### 3 说明

TPS3779 和 TPS3780 属于高精度双通道电压检测器系列, 同时拥有低功耗和小解决方案尺寸两大优势。SENSE1 和 SENSE2 输入包含滞后特性, 可抑制短小毛刺脉冲, 从而确保输出操作稳定而无错误触发。此系列产品提供 0.5%、1%、5% 或 10% 的不同出厂设定滞后选项。

TPS3779 和 TPS3780 具有可通过一个外部电阻分压器配置的可调感测 (SENSE) 输入。当 SENSE1 和 SENSE2 输入上的电压低于下降阈值时, OUT1 和 OUT2 被分别驱动为低电平。当 SENSE1 和 SENSE2 上升到高于上升阈值时, OUT1 和 OUT2 分别变为高电平。

该器件具有 2 $\mu$ A (典型值) 的超低静态电流, 并且提供了一套精确且节省空间的电压检测解决方案, 非常适合低功耗系统监视和便携式应用。TPS3779 和 TPS3780 的工作电压范围为 1.5V 至 6.5V, 工作温度范围为 -40°C 至 125°C。

## 8 Detailed Description

### 8.1 Overview

The TPS3779 and TPS3780 are a family of small, low quiescent current ( $I_{DD}$ ), dual-channel voltage detectors. These devices have high-accuracy, rising and falling input thresholds, and assert the output as shown in 表 1. The output (OUTx pin) goes low when the SENSEx pin is less than  $V_{IT-}$  and goes high when the pin is greater than  $V_{IT+}$ . The TPS3779 and TPS3780 offer multiple hysteresis options from 0.5% to 10% for use in a wide variety of applications. These devices have two independent voltage detection channels that can be used in systems where multiple voltage rails are required to be monitored, or where one channel can be used as an early warning signal and the other channel used as the system reset signal.

表 1. TPS3779, TPS3780 Truth Table

CONDITIONS	OUTPUT
$SENSE1 < V_{IT-}$	OUT1 = low
$SENSE2 < V_{IT-}$	OUT2 = low
$SENSE1 > V_{IT+}$	OUT1 = high
$SENSE2 > V_{IT+}$	OUT2 = high

## 8.3 Feature Description

### 8.3.1 Inputs (SENSE1, SENSE2)

The TPS3779 and TPS3780 have two comparators for voltage detection. Each comparator has one external input; the other input is connected to the internal reference. The comparator rising threshold is designed and trimmed to be equal to  $V_{IT+}$  and the falling threshold is trimmed to be equal to  $V_{IT-}$ . The built-in falling hysteresis options make the devices immune to supply rail noise and ensure stable operation.

The comparator inputs can swing from ground to 6.5 V, regardless of the device supply voltage used. Although not required in most cases, for extremely noisy applications, good analog design practice is to place a 1-nF to 10-nF bypass capacitor at the comparator input in order to reduce sensitivity to transients and layout parasitic.

For each SENSE input, the corresponding output (OUTx) is driven to logic low when the input voltage drops below  $V_{IT-}$ . When the voltage exceeds  $V_{IT+}$ , the output (OUTx) is driven high; see [Figure 1](#).

### 8.3.2 Outputs (OUT1, OUT2)

In a typical device application, the outputs are connected to a reset or enable input of another device, such as a digital signal processor (DSP), central processing unit (CPU), field-programmable gate array (FPGA), or application-specific integrated circuit (ASIC); or the outputs are connected to the enable input of a voltage regulator, such as a dc-dc or low-dropout (LDO) regulator.

The TPS3779 provides two push-pull outputs. The logic high level of the outputs is determined by the VDD pin voltage. With this configuration pull-up resistors are not required, thus saving board space. However, all interface logic levels must be examined. All OUT connections must be compatible with the VDD pin logic level.

The TPS3780 provides two open-drain outputs (OUT1 and OUT2); pull-up resistors must be used to hold these lines high when the output goes to a high-impedance condition (not asserted). By connecting pull-up resistors to the proper voltage rails, the outputs can be connected to other devices at correct interface voltage levels. The outputs can be pulled up to 6.5 V, independent of the device supply voltage. To ensure proper voltage levels, make sure to choose the correct pull-up resistor values. The pull-up resistor value is determined by  $V_{OL}$ , the sink current capability, and the output leakage current ( $I_{IKG(OD)}$ ). These values are specified in the [Electrical Characteristics](#) table. By using wired-AND logic, OUT1 and OUT2 can be combined into one logic signal. The [Inputs \(SENSE1, SENSE2\)](#) section describes how the outputs are asserted or deasserted. See [Figure 1](#) for a description of the relationship between threshold voltages and the respective output.

## 8.4 Device Functional Modes

### 8.4.1 Normal Operation ( $VDD \geq VDD(\min)$ )

When the voltage on VDD is greater than  $VDD(\min)$  for  $t_{SD}$ , the output signals react to the present state of the corresponding SENSE pins.

### 8.4.2 Power-On Reset ( $VDD < V_{(POR)}$ )

When the voltage on VDD is lower than the required voltage to internally pull the logic low output to GND ( $V_{(POR)}$ ), both outputs are undefined and are not to be relied upon for proper system function.

## 9 Application and Implementation

### 9.1 Application Information

The TPS3779 and TPS3780 are used as precision dual-voltage detectors. The monitored voltage, VDD voltage, and output pullup voltage (TPS3780 only) can be independent voltages or connected in any configuration.

#### 9.1.1 Threshold Overdrive

Threshold overdrive is how much VDD exceeds the specified threshold, and is important to know because smaller overdrive results in slower OUTx response. Threshold overdrive is calculated as a percent of the threshold in question, as shown in [公式 1](#):

$$\text{Overdrive} = | (VDD / V_{IT} - 1) \times 100\% |$$

where

- $V_{IT}$  is either  $V_{IT-}$  or  $V_{IT+}$ , depending on whether calculating the overdrive for the negative-going threshold or the positive-going threshold, respectively. (1)

[图 16](#) illustrates the VDD minimum detectable pulse versus overdrive, and is used to visualize the relationship overdrive has on  $t_{PD(f)}$  for negative-going events.

#### 9.1.2 Sense Resistor Divider

The resistor divider values and target threshold voltage can be calculated by using [公式 2](#) and [公式 3](#) to determine  $V_{MON(UV)}$  and  $V_{MON(PG)}$ , respectively.

$$V_{MON(UV)} = \left( 1 + \frac{R1}{R2} \right) \times V_{IT-} \quad (2)$$

$$V_{MON(PG)} = \left( 1 + \frac{R1}{R2} \right) \times V_{IT+} \quad (3)$$

where

- R1 and R2 are the resistor values for the resistor divider on the SENSEx pins,
- $V_{MON(UV)}$  is the target voltage at which an undervoltage condition is detected, and
- $V_{MON(PG)}$  is the target voltage at which the output goes high when  $V_{MONx}$  rises.

Choose  $R_{TOTAL}$  ( $= R1 + R2$ ) so that the current through the divider is approximately 100 times higher than the input current at the SENSEx pins. The resistors can have high values to minimize current consumption as a result of low input bias current without adding significant error to the resistive divider. For details on sizing input resistors, refer to application report [SLVA450](#), *Optimizing Resistor Dividers at a Comparator Input*, available for download from [www.ti.com](http://www.ti.com).

- The resistor divider values are calculated by using 公式 2 and 公式 3. For SENSE1,  $R1 = 1.13\text{ M}\Omega$  and  $R2 = 787\text{ k}\Omega$ . For SENSE2,  $R3 (R1) = 681\text{ k}\Omega$  and  $R4 (R2) = 576\text{ k}\Omega$ .

表 3. Design Parameters

PARAMETER	DESIGN REQUIREMENT	DESIGN RESULT
VDD	$V_{MON}$	$V_{MON}$
Hysteresis	10%	10%
Monitored voltage 1	$V_{MON(PG)} = 3.3 \text{ V}$ , $V_{MON(UV)} = 3 \text{ V}$	$V_{MON(PG)} = 3.330 \text{ V}$ , $V_{MON(UV)} = 2.997 \text{ V}$
Monitored voltage 2	$V_{MON(PG)} = 3.9 \text{ V}$ , $V_{MON(UV)} = 3.5 \text{ V}$	$V_{MON(PG)} = 3.921 \text{ V}$ , $V_{MON(UV)} = 3.529 \text{ V}$

### 9.4.2 Detailed Design Procedure

1. Select the TPS3779C. The C version is selected to satisfy the hysteresis requirement. The TPS3779 is selected to save on component count and board space.
2. Use 公式 4 to calculate the total resistance for the resistor divider. Determine the minimum total resistance of the resistor network necessary to achieve the current consumption specification. For this example, the current flow through the resistor network is chosen to be 1.41  $\mu\text{A}$ . Use the key transition point for  $V_{MON2}$ . For this example, the low-to-high transition,  $V_{MON(PG)}$ , is considered more important.

$$R_{TOTAL} = \frac{V_{MON(PG\_2)}}{I} = \frac{3.9 \text{ V}}{1.41 \mu\text{A}} = 2.78 \text{ M}\Omega$$

where

- $V_{MON(PG\_2)}$  is the target voltage at which OUT2 goes high when  $V_{MON2}$  rises, and
- $I$  is the current flowing through the resistor network. (4)

3. After  $R_{TOTAL}$  is determined, R3 can be calculated using 公式 5. Select the nearest 1% resistor value for R3. In this case, 845 k $\Omega$  is the closest value.

$$R3 = \frac{V_{IT+}}{I} = \frac{1.194 \text{ V}}{1.41 \mu\text{A}} = 846 \text{ k}\Omega \quad (5)$$

4. Use 公式 6 to calculate R2. Select the nearest 1% resistor value for R2. In this case, 150 k $\Omega$  is the closest value. Use the key transition point for  $V_{MON1}$ . For this example, the low-to-high transition,  $V_{MON(UV)}$ , is considered more important.

$$R2 = \frac{R_{TOTAL}}{V_{MON(UV\_1)}} \cdot V_{IT-} - R3 = \frac{2.78 \text{ M}\Omega}{3 \text{ V}} \cdot 1.074 \text{ V} - 845 \text{ k}\Omega = 149 \text{ k}\Omega$$

where

- $V_{MON(UV\_1)}$  is the target voltage at which OUT1 goes low when  $V_{MON1}$  falls. (6)

5. Use 公式 7 to calculate R1. Select the nearest 1% resistor value for R1. In this case, 1.78 MΩ is a 1% resistor.

$$R1 = R_{TOTAL} - R2 - R3 = 2.78 \text{ M}\Omega - 150 \text{ k}\Omega - 845 \text{ k}\Omega = 1.78 \text{ M}\Omega \quad (7)$$

### 9.4.3 Application Curve

图 25. Early Warning Detection Curve

## 10 Power-Supply Recommendations

The TPS3779 and TPS3780 are designed to operate from an input voltage supply range between 1.5 V and 6.5 V. An input supply capacitor is not required for this device; however, good analog practice (required for less VDD < 1.5 V) is to place a 0.1-μF or greater capacitor between the VDD pin and the GND pin. This device has a 7-V absolute maximum rating on the VDD pin. If the voltage supply providing power to VDD is susceptible to any large voltage transient that can exceed 7 V, additional precautions must be taken.

For applications where SENSE is greater than 0 V before VDD, and subject to a startup slew rate of less than 200 mV per 1 ms, the output can be driven to logic high in error. To correct the output, cycle the SENSE lines below V<sub>IT-</sub> or sequence SENSE after VDD.

## 11 Layout

### 11.1 Layout Guidelines

Place the VDD decoupling capacitor close to the device.

Avoid using long traces for the VDD supply node. The VDD capacitor, along with parasitic inductance from the supply to the capacitor, can form an LC tank and create ringing with peak voltages above the maximum VDD voltage.

EVM 可通过德州仪器 (TI) 网站上的 [TPS3779](#) 和 [TPS3780](#) 产品文件夹获取, 也可直接从 [TI 网上商店](#) 购买。

##### 12.1.1.2 Spice 模型

分析模拟电路和系统的性能时, 使用 SPICE 模型对电路性能进行计算机仿真非常有用。您可以从相应器件产品文件夹中的 *仿真模型* 下获取 TPS3779 和 TPS3780 的 SPICE 模型。

#### 12.1.2 器件命名规则

TPS3779xyyyz 和 TPS3780xyyyz 是这些器件的通用命名约定。TPS3779 和 TPS3780 代表此类器件所属系列; x 用于表示滞后版本, yyy 预留给封装标识符, z 为封装数量。

- 示例: TPS3779CDBVR
- 系列: TPS3779 (推挽)
- 滞后: 10%
- DBV 封装: 6 引脚 SOT
- 封装数量: R 表示卷 (3000 片)

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
