

# 的 TPS650864 可配置多轨 PMU 适用于多核处理器、FPGA 和系统的 TPS650861 可配置多轨 PMU

## 1 器件概述

### 1.1 特性

- 两组用于为默认电压和序列进行编程的一次性可编程内存
- 5.6V 至 21V 的宽输入电压范围
- 三个采用 D-CAP2™ 拓扑的可变输出电压同步降压控制器
  - 使用外部 FET 的可扩展输出电流，支持可选电流限制
  - 在 0.41V 至 1.67V 之间以 10mV 为步长、在 1V 至 3.575V 之间以 25mV 为步长或固定 5V 输出的 I<sup>2</sup>C DVS 控制
- 三个采用 DCS-Control 拓扑的可变输出电压同步降压转换器
  - 输入电压范围为 3V 至 5.5 V
  - 输出电流高达 3A
  - 在 0.425V 至 3.575V 在 25mV 为步长的 I<sup>2</sup>C 控制
- 三个具有可调节输出电压的 LDO 稳压器
  - LDOA1: I<sup>2</sup>C 可选输出电压为 1.35V 至 3.3V，输出电流最高 200mA
  - LDOA2 和 LDOA3: I<sup>2</sup>C 可选输出为 0.7V 至 1.5V，各输出电流均为最高 600mA
- 用于 DDR 存储器终端的 VTT LDO
- 三个具有压摆率控制功能的负载开关
  - 输出电流高达 300mA，压降小于标称输入电压的 1.5%
  - 输入电压为 1.8V 时，R<sub>DS(on)</sub> < 96mΩ
- 5V 固定输出电压 LDO (LDO5)
  - 用于 SMPS 的栅极驱动器和 LDOA1 的电源
  - 可自动切换至外部 5V 降压以实现更高效率
- 内置可通过 OTP 编程功能实现的灵活性和可配置性
  - 六个 GPI 引脚均可配置为启用 (CTL1 至 CTL6) 任意所选电压轨或使其进入睡眠模式 (CTL3 和 CTL6)
  - 四个 GPO 引脚均可配置为指示任意所选轨道的电源正常
  - 漏极开路中断输出引脚
- I<sup>2</sup>C 接口支持标准模式 (100kHz)、快速模式 (400kHz) 和超快速模式 (1MHz)

### 1.2 应用

- 可编程逻辑控制器
- 机器视觉摄像机
- 视频监控
- 测试和测量
- 嵌入式 PC
- 运动控制

### 1.3 说明

TPS650861 器件系列是一款单芯片电源管理 IC (PMIC)，按照设计，其经编程可实现最佳的输出电压和电源定序。TPS650861 具有三个控制器，可提供最高 30A 电流的灵活供电能力，采用可满足大功率设计需求的大型外部 FET，但该 FET 的使用可降低尺寸和成本，获得更小巧的设计。通过将三个 3A 转换器、三个通用 LDO、一个适用于 DDR 的终端 LDO 以及三个负载开关相结合，TPS650861 可为多种应用提供系统电源。该 D-CAP2™ 和 DCS-Control 高频稳压器采用小型无源器件，以减小解决方案尺寸。D-CAP2 和 DCS-Control 拓扑具有出色的瞬态响应性能，非常适用于具有快速负载开关的处理器内核和系统内存电压轨。该器件具有两组一次性可编程 (OTP) 内存。如需大量采购，请联系当地的 TI 销售代表，以确定是否能够使用 TI 制造的产品进行 OTP 定制。第三方经销商也支持为 TPS650861 编程。

器件信息<sup>(1)</sup>

器件型号	封装	封装尺寸 (标称值)
TPS650861	VQFN (64)	8.00mm x 8.00mm

### 3 Pin Configuration and Functions

Figure 3-1 shows the 64-pin RSK Plastic Quad Flatpack No-Lead package.

NOTE: The thermal pad must be connected to the system power ground plane.

Figure 3-1. 64-Pin RSK VQFN With Exposed Thermal Pad (Top View)

#### 3.1 Pin Functions

##### Pin Functions

PIN		I/O	DESCRIPTION
NO.	NAME		
<b>SMPS REGULATORS</b>			
1	FBGND2	I	Remote negative feedback sense for BUCK2 controller. Connect to negative terminal of output capacitor. Connect to ground when not in use.

### Pin Functions (continued)

PIN		I/O	DESCRIPTION
NO.	NAME		
2	FBVOUT2	I	Remote positive feedback sense for BUCK2 controller. Connect to positive terminal of output capacitor. Connect to ground when not in use.
3	DRVH2	O	High-side gate driver output for BUCK2 controller. Leave floating when not in use.
4	SW2	I	Switch node connection for BUCK2 controller. Connect to ground when not in use.
5	BOOT2	I	Bootstrap pin for BUCK2 controller. Connect a 100-nF ceramic capacitor between this pin and SW2 pin. Leave floating when not in use.
6	PGNDSNS2	I	Power GND connection for BUCK2. Connect to ground terminal of external low-side FET. Connect to ground when not in use.
7	DRVL2	O	Low-side gate driver output for BUCK2 controller. Leave floating when not in use.
8	DRV5V_2_A1	I	5-V supply to BUCK2 gate driver and LDOA1. Bypass to ground with a 2.2- $\mu$ F (typical) ceramic capacitor. Shorted on board to LDO5P0 pin typically. Bypass not required if BUCK2 and LDOA1 are not in use.
10	LX3	O	Switch node connection for BUCK3 converter. Connect to ground when not in use.
11	PVIN3	I	Power input to BUCK3 converter. Bypass to ground with a 10- $\mu$ F (typical) ceramic capacitor. Bypass not required if BUCK3 is not in use.
12	FB3	I	Remote feedback sense for BUCK3 converter. Connect to positive terminal of output capacitor. Connect to ground when not in use.
20	LX5	O	Switch node connection for BUCK5 converter. Leave floating when not in use.
21	PVIN5	I	Power input to BUCK5 converter. Bypass to ground with a 10- $\mu$ F (typical) ceramic capacitor. Bypass not required if BUCK5 is not in use.
22	FB5	I	Remote feedback sense for BUCK5 converter. Connect to positive terminal of output capacitor. Connect to ground when not in use.
23	FB4	I	Remote feedback sense for BUCK4 converter. Connect to positive terminal of output capacitor. Connect to ground when not in use.
24	PVIN4	I	Power input to BUCK4 converter. Bypass to ground with a 10- $\mu$ F (typical) ceramic capacitor. Bypass not required if BUCK4 is not in use.
25	LX4	O	Switch node connection for BUCK4 converter. Leave floating when not in use.
29	FBVOUT1	I	Remote feedback sense for BUCK1 controller. Connect to positive terminal of output capacitor. Connect to ground when not in use.
30	ILIM1	I	Current limit set pin for BUCK1 controller. Fit a resistor from this pin to ground to set current limit of external low-side FET. Connect to ground when BUCK1 not in use.
33	DRVH1	O	High-side gate driver output for BUCK1 controller. Leave floating when not in use.
34	SW1	I	Switch node connection for BUCK1 controller. Connect to ground when not in use.
35	BOOT1	I	Bootstrap pin for BUCK1 controller. Connect a 100-nF ceramic capacitor between this pin and SW1 pin. Leave floating when not in use.
36	PGNDSNS1	I	Power GND connection for BUCK1. Connect to ground terminal of external low-side FET. Connect to ground when not in use.
37	DRVL1	O	Low-side gate driver output for BUCK1 controller. Leave floating when not in use.
38	DRV5V_1_6	I	5-V supply to BUCK1 and BUCK6 gate drivers. Bypass to ground with a 2.2- $\mu$ F (typical) ceramic capacitor. Shorted on board to LDO5P0 pin typically. Bypass not required if BUCK1 and BUCK6 are not in use.
39	DRVL6	O	Low-side gate driver output for BUCK6 controller. Leave floating when not in use.
40	PGNDSNS6	I	Power GND connection for BUCK6. Connect to ground terminal of external low-side FET. Connect to ground when not in use.
41	BOOT6	I	Bootstrap pin for BUCK6 controller. Connect a 100-nF ceramic capacitor between this pin and SW6 pin. Leave floating when not in use.
42	SW6	I	Switch node connection for BUCK6 controller. Connect to ground when not in use.
43	DRVH6	O	High-side gate driver output for BUCK6 controller. Leave floating when not in use.
44	FBVOUT6	I	Remote feedback sense for BUCK6 controller and reference voltage for VTT LDO regulation. Connect to positive terminal of output capacitor. Connect to ground when not in use.
45	ILIM6	I	Current limit set pin for BUCK6 controller. Fit a resistor from this pin to ground to set current limit of external low-side FET. Connect to ground when BUCK6 not in use.
64	ILIM2	I	Current limit set pin for BUCK2 controller. Fit a resistor from this pin to ground to set current limit of external low-side FET. Connect to ground when BUCK2 not in use.
<b>LDO AND LOAD SWITCHES</b>			
9	LDOA1	O	LDOA1 output. Bypass to ground with a 4.7- $\mu$ F (typical) ceramic capacitor. Leave floating when not in use.
17	SWB1	O	Output of load switch B1. Bypass to ground with a 0.1- $\mu$ F (typical) ceramic capacitor. Leave floating when not in use.
18	PVINSWB1_B2	I	Power supply to load switch B1 and B2. Bypass to ground with a 1- $\mu$ F (typical) ceramic capacitor to improve transient performance. Connect to ground when not in use.

### Pin Functions (continued)

PIN		I/O	DESCRIPTION
NO.	NAME		
19	SWB2	O	Output of load switch B2. Bypass to ground with a 0.1- $\mu$ F (typical) ceramic capacitor. Leave floating when not in use.
31	SWA1	O	Output of load switch A1. Bypass to ground with a 0.1- $\mu$ F (typical) ceramic capacitor. Leave floating when not in use.
32	PVINSWA1	I	Power supply to load switch A1. Bypass to ground with a 1- $\mu$ F (typical) ceramic capacitor to improve transient performance. Connect to ground when not in use.
46	PVINVTT	I	Power supply to VTT LDO. Bypass to ground with a 10- $\mu$ F (minimum) ceramic capacitor. Bypass not required if VTT LDO is not in use.
47	VTT	O	Output of load VTT LDO. Bypass to ground with 2 $\times$ 22- $\mu$ F (minimum) ceramic capacitors. Leave floating when not in use.
48	VTTFB	I	Remote feedback sense for VTT LDO. Connect to positive terminal of output capacitor. Connect to ground when not in use.
49	LDOA3	O	Output of LDOA3. Bypass to ground with a 4.7- $\mu$ F (typical) ceramic capacitor. Leave floating when not in use.
50	PVINLDOA2_A3	I	Power supply to LDOA2 and LDOA3. Bypass to ground with a 4.7- $\mu$ F (typical) ceramic capacitor. Connect to ground when not in use.
51	LDOA2	O	Output of LDOA2. Bypass to ground with a 4.7- $\mu$ F (typical) ceramic capacitor. Leave floating when not in use.
54	LDO3P3	O	Output of 3.3-V internal LDO. Bypass to ground with a 4.7- $\mu$ F (typical) ceramic capacitor.
56	LDO5P0	O	Output of 5-V internal LDO or an internal switch that connects this pin to V5ANA. Bypass to ground with a 4.7- $\mu$ F (typical) ceramic capacitor.
57	V5ANA	I	Bias used by converters (BUCK3, BUCK4, and BUCK5) for regulation. Must be same supply as PVINx. Also has an internal load switch that connects this pin to LDO5P0 pin if 5-V is used. Bypass this pin with an optional ceramic capacitor to improve transient performance.
<b>INTERFACE</b>			
13	CTL1	I	Active-high VR enable pin. A group of VRs can be assigned to be enabled at assertion or disabled at deassertion of this pin.
14	CTL6/SLPENB2	I	Active-high VR enable pin. A group of VRs can be assigned to be enabled at assertion or disabled at deassertion of this pin. Alternatively, when configured to active-low sleep enable, a group of VRs chosen can be entered into (L) or out of (H) sleep state where their output voltages may be different from those in normal state.
15	IRQB	O	Open-drain output interrupt pin. Refer to <a href="#">Section 5.11.4, IRQ: PMIC Interrupt Register</a> , for definitions. For programming, this pin must be supplied with a stable 7-V supply to burn the OTP memory. Recommend bypassing to ground with a 1- $\mu$ F (typical) ceramic capacitor. Do not back-drive any pull-up on this output if programming. <sup>(1)</sup>
16	GPO1	O	General purpose output that can be configured to either open-drain or push-pull arrangement. Regardless of the configuration, the pin can be programmed either to reflect Power Good status of VRs of any choice or to be controlled by an I <sup>2</sup> C register bit by the user, which then can be used as an enable signal to an external VR.
26	GPO2	O	General purpose output that can be configured to either open-drain or push-pull arrangement. Regardless of the configuration, the pin can be programmed either to reflect Power Good status of VRs of any choice or to be controlled by an I <sup>2</sup> C register bit by the user, which then can be used as an enable signal to an external VR.
27	GPO3	O	General purpose output that can be configured to either open-drain or push-pull arrangement. Regardless of the configuration, the pin can be programmed either to reflect Power Good status of VRs of any choice or to be controlled by an I <sup>2</sup> C register bit by the user, which then can be used as an enable signal to an external VR.
28	GPO4	O	Open-drain output that can be configured to reflect Power Good status of VRs of any choice or to be controlled by an I <sup>2</sup> C register bit by the user, which then can be used as an enable signal to an external VR.
58	CLK	I	I <sup>2</sup> C clock
59	DATA	I/O	I <sup>2</sup> C data
60	CTL2	I	Active-high VR enable pin. A group of VRs can be assigned to be enabled at assertion or disabled at deassertion of this pin.
61	CTL3/SLPENB1	I	Active-high VR enable pin. A group of VRs can be assigned to be enabled at assertion or disabled at deassertion of this pin. Alternatively, when configured to active-low sleep enable, a group of VRs chosen can be entered into (L) or out of (H) sleep state where their output voltages may be different from those in normal state.
62	CTL4	I	Active-high VR enable pin. A group of VRs can be assigned to be enabled at assertion or disabled at deassertion of this pin. For programming, this pin must be supplied with a stable 7-V supply to enter the programming state. Because of this requirement, CTL4 is generally not used to enable or disable regulators for the TPS650861 to avoid enabling rails during programming or damaging devices connected to CTL4. No bypass capacitor is needed for this pin. <sup>(1)</sup>
63	CTL5	I	Active-high VR enable pin. A group of VRs can be assigned to be enabled at assertion or disabled at deassertion of this pin.
<b>REFERENCE</b>			
52	AGND	—	Analog ground. Do not connect to the thermal pad ground on top layer. Connect to ground of VREF capacitor.
53	VREF	O	Band-gap reference output. Stabilize it by connecting a 100-nF (typical) ceramic capacitor between this pin and quiet ground.
55	VSYS	I	System voltage detection and input to internal LDOs (3.3 V and 5 V). Bypass to ground with a 1- $\mu$ F (typical) ceramic capacitor.

(1) Ambient temperature must remain below 50 °C during programming, total time must be less than one minute.

### Pin Functions (continued)

PIN		I/O	DESCRIPTION
NO.	NAME		
<b>THERMAL PAD</b>			
—	Thermal pad (PGND)	—	Connect to PCB ground plane using multiple vias for good thermal and electrical performance.

## 4 Specifications

### 4.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

	MIN	MAX	UNIT
<b>ANALOG</b>			
Input voltage from battery, V <sub>SYS</sub>	−0.3	28	V
PVIN3, PVIN4, PVIN5, LDO5P0, DRV5V_1_6, DRV5V_2_A1, DRVL1, DRVL2, DRVL6	−0.3	7	V
V5ANA	−0.3	6	V
PGNDSNS1, PGNDSNS2, PGNDSNS6, AGND, FBGND2	−0.3	0.3	V
DRVH1, DRVH2, DRVH6, BOOT1, BOOT2, BOOT6	−0.3	34	V
SW1, SW2, SW6	−5 <sup>(2)</sup>	28	V
LX3, LX4, LX5	−2 <sup>(3)</sup>	8	V
Differential voltage, BOOTx to SWx	−0.3	5.5	V
VREF, LDO3P3, FBVOUT1, FBVOUT2, FBVOUT6, FB3, FB4, FB5, ILIM1, ILIM2, ILIM6, PVINVT, VTT, VTTFB, PVINSWA1, SWA1, PVINSWB1_B2, SWB1, SWB2, LDOA1	−0.3	3.6	V
PVINLDOA2_A3, LDOA2, LDOA3	−0.3	3.3	V
<b>DIGITAL IO</b>			
DATA, CLK, GPO1-GPO3	−0.3	3.6	V
CTL1-CTL6, GPO4, IRQB (normal use)	−0.3	7	V
CTL4, IRQB (programming) <sup>(4)</sup>	−0.3	8.4	V
Storage temperature, T <sub>stg</sub>	−40	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) Transient for less than 5 ns

(3) Transient for less than 20 ns

(4) Ambient temperature must remain below 50 °C during programming, total time must be less than one minute.

### 4.2 ESD Ratings

	VALUE	UNIT
V <sub>ESD</sub> Electrostatic discharge	Human Body Model (HBM), per ANSI/ESDA/JEDEC JS001 <sup>(1)</sup>	±1000
	Charged Device Model (CDM), per JESD22-C101 <sup>(2)</sup>	±250

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 4.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	NOM	MAX	UNIT
<b>ANALOG</b>				
V <sub>SYS</sub>	5.6	13	21	V
V <sub>REF</sub>	–0.3		1.3	V
PVIN3, PVIN4, PVIN5, LDO5P0, V5ANA, DRV5V_1_6, DRV5V_2_A1	–0.3		5.5	V
PGNDSNS1, PGNDSNS2, PGNDSNS6, AGND, FBGND2	–0.3		0.3	V
DRVH1, DRVH2, DRVH6, BOOT1, BOOT2, BOOT6	–0.3		26.5	v
DRVL1, DRVL2, DRVL6	–0.3		5.5	V
SW1, SW2, SW6	–1		21	V
LX3, LX4, LX5	–1		5.5	V
FBVOUT1, FBVOUT2, FBVOUT6, FB3, FB4, FB5	–0.3		3.6	V
LDO3P3, ILIM1, ILIM2, ILIM6, LDOA1	–0.3		3.3	V
PVINVTT	–0.3	BUCK6	FBVOUT6	V
V <sub>TT</sub> , V <sub>TTFB</sub>	–0.3		0.5 × FBVOUT6	V
PVINSWA1, SWA1, PVINSWB1_B2, SWB1, SWB2	–0.3		3.6	V
PVINLDOA2_A3	–0.3		1.8	V
LDOA2, LDOA3	–0.3		1.5	V
<b>DIGITAL IO</b>				
DATA, CLK, CTL1–CTL6, GPO1–GPO4, IRQB (normal use)	–0.3		3.3	V
CTL4, IRQB (during programming) <sup>(1)</sup>	6.7	7	7.3	V
<b>CHIP</b>				
Operating ambient temperature, T <sub>A</sub>	–40	27	85	°C
Operating junction temperature, T <sub>J</sub>	–40	27	125	°C

(1) Ambient temperature must remain below 50 °C during programming, total time must be less than one minute.

### 4.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		TPS650861	UNIT
		RSK (VQFN)	
		64 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	25.8	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	11.3	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	4.4	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.2	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	4.4	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	0.7	°C/W

(1) For more information about traditional and new thermal metrics, see [Semiconductor and IC Package Thermal Metrics application report](#).

### 4.5 Electrical Characteristics: Total Current Consumption

over recommended free-air temperature range and over recommended input voltage range (typical values are at T<sub>A</sub> = 25°C) (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
I <sub>SD</sub>	PMIC shutdown current that includes I <sub>Q</sub> for references, LDO5, LDO3P3, and digital core		65		μA

## 4.6 Electrical Characteristics: Reference and Monitoring System

over recommended free-air temperature range and over recommended input voltage range (typical values are at  $T_A = 25^\circ\text{C}$ ) (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>REFERENCE</b>						
$V_{REF}$	Band-gap reference voltage			1.25		V
	Accuracy		-0.5%		0.5%	
$C_{VREF}$	Band-gap output capacitor		0.047	0.1	0.22	$\mu\text{F}$
$V_{SYS\_UVLO\_5V}$	VSYS UVLO threshold for LDO5	$V_{SYS}$ falling	5.24	5.4	5.56	V
$V_{SYS\_UVLO\_5V\_HYS}$	VSYS UVLO threshold hysteresis for LDO5	$V_{SYS}$ rising above $V_{SYS\_UVLO\_5V}$		200		mV
$V_{SYS\_UVLO\_3V}$	VSYS UVLO threshold for LDO3P3	$V_{SYS}$ falling	3.45	3.6	3.75	V
$V_{SYS\_UVLO\_3V\_HYS}$	VSYS UVLO threshold hysteresis for LDO3P3	$V_{SYS}$ rising above $V_{SYS\_UVLO\_3V}$		150		mV
$T_{CRIT}$	Critical threshold of die temperature	$T_J$ rising	130	145	160	$^\circ\text{C}$
$T_{CRIT\_HYS}$	Hysteresis of $T_{CRIT}$	$T_J$ falling		10		$^\circ\text{C}$
$T_{HOT}$	Hot threshold of die temperature	$T_J$ rising	110	115	120	$^\circ\text{C}$
$T_{HOT\_HYS}$	Hysteresis of $T_{HOT}$	$T_J$ falling		10		$^\circ\text{C}$
<b>LDO5</b>						
$V_{IN}$	Input voltage at $V_{SYS}$ pin		5.6	13	21	V
$V_{OUT}$	DC output voltage	$I_{OUT} = 10\text{ mA}$	4.9	5	5.1	V
$I_{OUT}$	DC output current			100	180	mA
$I_{OCP}$	Overcurrent protection	Measured with output shorted to ground	200			mA
$V_{TH\_PG}$	Power Good assertion threshold in percentage of target $V_{OUT}$	$V_{OUT}$ rising		94%		
$V_{TH\_PG\_HYS}$	Power Good deassertion hysteresis	$V_{OUT}$ rising or falling		4%		
$I_Q$	Quiescent current	$V_{IN} = 13\text{ V}$ , $I_{OUT} = 0\text{ A}$		20		$\mu\text{A}$
$C_{OUT}$	External output capacitance		2.7	4.7	10	$\mu\text{F}$
<b>V5ANA-to-LDO5P0 LOAD SWITCH</b>						
$R_{DSON}$	On resistance	$V_{IN} = 5\text{ V}$ , measured from V5ANA pin to LDO5P0 pin at $I_{OUT} = 200\text{ mA}$			1	$\Omega$
$V_{TH\_PG}$	Power Good threshold for external 5-V supply	$V_{V5ANA}$ rising		4.7		V
$V_{TH\_HYS\_PG}$	Power Good threshold hysteresis for external 5-V supply	$V_{V5ANA}$ falling		100		mV
$I_{LKG}$	Leakage current	Switch disabled, $V_{V5ANA} = 5\text{ V}$ , $V_{LDO5} = 0\text{ V}$			10	$\mu\text{A}$
<b>LDO3P3</b>						
$V_{IN}$	Input voltage at $V_{SYS}$ pin		5.6	13	21	V
$V_{OUT}$	DC output voltage	$I_{OUT} = 10\text{ mA}$		3.3		V

## 5 Detailed Description

### 5.1 Overview

The TPS650861 power-management integrated circuit (PMIC) provides a highly flexible, programmable, and configurable power solution that can power a wide array of processors along with DDR3/DDR4 memory and other peripherals. Integrated in the PMIC are three step-down controllers (BUCK1, BUCK2, and BUCK6), three step-down converters (BUCK3, BUCK4, and BUCK5), a sink or source LDO (VTT LDO), three low-voltage  $V_{IN}$  LDOs (LDOA1–LDOA3), and three load switches (SWA1, SWB1, and SWB2). With on-chip one-time programmable (OTP) memory, configuration of each rail for default output value, power-up sequence, fault handling, and Power Good mapping into a GPO pin are all conveniently flexible. The TPS650861 has two OTP memory banks which are designed to be programmed to fit different designs. (See [Section 5.7](#)) All VRs have a built-in discharge resistor, and the value can be changed using the DISCHCNT1–DISCHCNT3 and LDOA1\_SWB2\_CTRL registers. When enabling a VR, the PMIC automatically disconnects the discharge resistor for that rail without any I<sup>2</sup>C command. lists the key characteristics of the voltage rails.

**Table 5-1. Summary of Voltage Regulators**

RAIL	TYPE	INPUT VOLTAGE (V)		OUTPUT VOLTAGE RANGE (V)			CURRENT (mA)
		MIN	MAX	MIN	TYP	MAX	
BUCK1	Step-down controller	4.5	21	0.41	OTP-programmable	3.575	scalable
BUCK2	Step-down controller	4.5	21	0.41	OTP-programmable	3.575	scalable
BUCK3	Step-down converter	3	5.5	0.41	OTP-programmable	3.575	3000
BUCK4	Step-down Converter	3	5.5	0.41	OTP-programmable	3.575	3000
BUCK5	Step-down converter	3	5.5	0.41	OTP-programmable	3.575	3000
BUCK6	Step-down controller	4.5	21	0.41	OTP-programmable	3.575	scalable
LDOA1	LDO	4.5	5.5	1.35	OTP-programmable	3.3	200 <sup>(1)</sup>
LDOA2	LDO	1.62	1.98	0.7	OTP-programmable	1.5	600
LDOA3	LDO	1.62	1.98	0.7	OTP-programmable	1.5	600
SWA1	Load switch	0.5	3.3				300
SWB1/SWB2	Load switch	0.5	3.3				400
VTT	Sink and source LDO	1.1	1.8		FBVOUT6 / 2		OTP-programmable

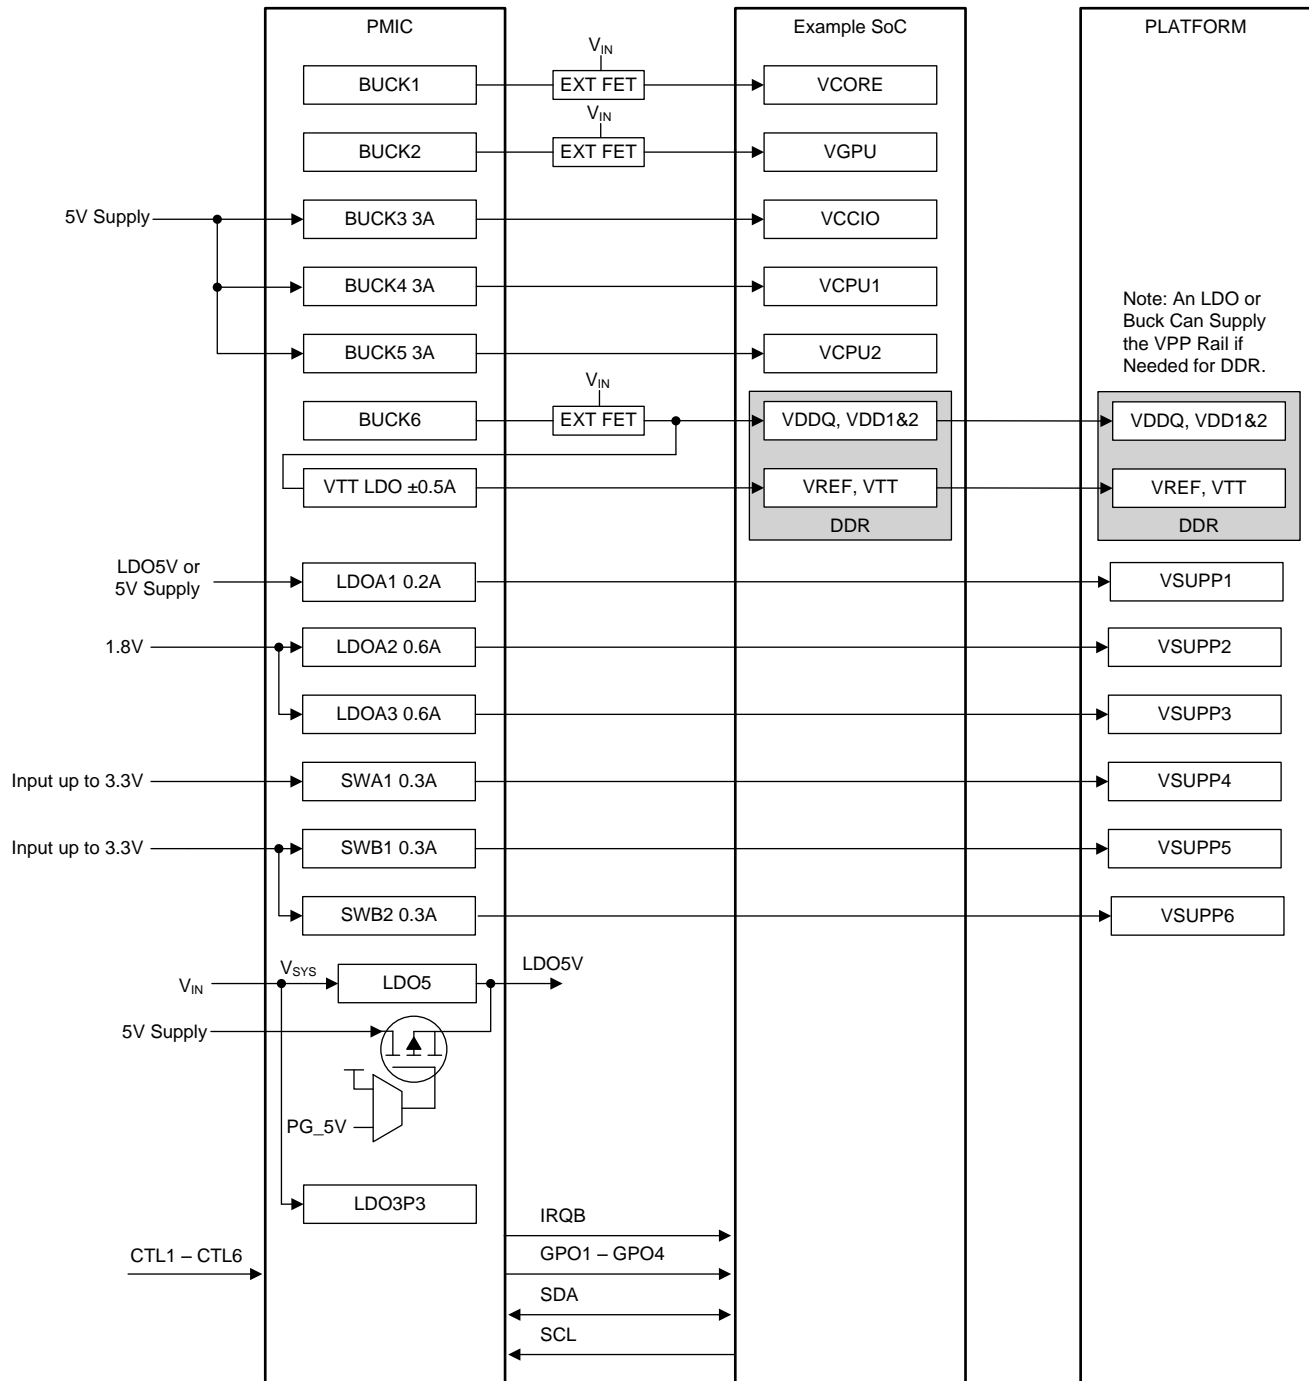

(1) When powered from a 5-V supply through the DRV5V\_2\_A1 pin. Otherwise, max current is limited by max  $I_{OUT}$  of LDO5.

### 5.3 Programming the TPS650861

Detailed information regarding the programming of the non-volatile one-time programmable (OTP) memory is available in the [TPS65086100 OTP Memory Programming Guide](#).

## 5.4 SMPS Voltage Regulators

The buck controllers integrate gate drivers for external power stages with programmable current limit (set by an external resistor at ILIMx pin), which allows for optimal selection of external passive components based on the desired system load. The buck converters include integrated power stage and require a minimum number of pins for power input, inductor, and output voltage feedback input. Combined with high-frequency switching, all these features allow use of inductors in small form factor, thus reducing total-system cost and size.

The controllers, BUCK1, BUCK2, and BUCK6, have selectable auto- and forced-pulse width modulation (PWM) mode through the BUCKx\_MODE bit in the BUCKxCTRL register. In auto mode, the VR automatically switches between PWM and pulsed frequency modulation (PFM) (discontinuous conduction mode) depending on the output load to maximize efficiency. In Force PWM mode, the VR remains in PWM (constant conduction mode) in order to keep the regulator switching even at low load to prevent switching noise in the audible range. The converters, BUCK3, BUCK4, and BUCK5, only support Forced PWM mode.

All controllers and converters can be used with the default  $V_{OUT}$  or can have their voltage dynamically changed at any time. This means that the rails can be default programmed for any available  $V_{OUT}$  by OTP programming locally or at the factory, so the device starts up with the default voltage, or during operation the rail can be configured by I<sup>2</sup>C to another operating  $V_{OUT}$  while the rail is enable or disabled. There are two step sizes or ranges available for  $V_{OUT}$  selection for controllers: 10-mV and 25-mV steps. The step-size range must be selected prior to use and must be programmed in the OTP locally or at the factory. It is not subject to change during operation.

For the 10-mV step-size range  $V_{OUT}$  options, see [Table 5-2](#). For the 25-mV step-size range  $V_{OUT}$  options, see [Table 5-3](#).

### 5.4.1 Controller Overview

The controllers are fast-reacting, high-frequency, scalable output power controllers capable of driving two external N-MOSFETs. They are D-CAP2 controller scheme that optimizes transient responses at high load currents for such applications as CORE and DDR supplies. The output voltage is compared with internal reference voltage after divider resistors. The PWM comparator determines the timing to turn on the high-side MOSFET. The PWM comparator response maintains a very small PWM output ripple voltage. Because the device does not have a dedicated oscillator for control loop on board, switching cycle is controlled by the adaptive on-time circuit. The on-time is controlled to meet the target switching frequency by feed-forwarding the input and output voltage into the on-time one-shot timer.

The D-CAP2 control scheme has an injected ripple from the SW node that is added to the reference voltage to simulate output ripple, which eliminates the need for ESR-induced output ripple from D-CAP™ mode control. Thus, low-ESR output capacitors (such as low-cost ceramic MLCC capacitors) can be used with the controllers.

Figure 5-3. Controller Block Diagram

### 5.4.2 Converter Overview

The PMIC synchronous step-down DCDC converters include a unique hysteretic PWM controller scheme which enables a high switching frequency converter, excellent transient and AC load regulation as well as operation with cost-competitive external components. The device operates on a quasi-fixed frequency and allows filtering of the switch noise by external filter components. The PMIC device offers fixed output voltage options featuring smallest solution size by using only three external components per converter.

A significant advantage of PMIC compared to other hysteretic PWM controller topologies is its excellent AC load transient regulation capability. When the output voltage falls below the threshold of the error comparator, a switch pulse is initiated, and the high-side switch is turned on. The high-side switch remains turned on until a minimum ON-time of  $t_{ONmin}$  expires and the output voltage trips the threshold of the error comparator or the inductor current reaches the high-side switch current limit. When the high-side switch turns off, the low-side switch rectifier is turned on and the inductor current ramps down until the high-side switch turns on again. In PWM mode operation, negative inductor current is allowed to enable continuous conduction mode even at no load condition.

Figure 5-4. Converter Block Diagram

### 5.4.3 DVS

BUCK1–BUCK6 support dynamic voltage scaling (DVS) for maximum system efficiency. The VR outputs can slew up and down in either 10-mV or 25-mV steps using the 7-bit voltage ID (VID) defined in Section 4.7 and Section 4.8. DVS slew rate is minimum 2.5 mV/μs. In order to meet the minimum slew rate, VID progresses to the next code at 3-μs (nom) interval per 10-mV or at 6-μs interval per 25-mV steps. When DVS is active, the VR is forced into PWM mode, unless BUCKx\_DECAY = 1, to ensure the output keeps track of VID code with minimal delay. Additionally, PGOOD is masked when DVS is in progress. Figure 5-5 shows an example of slew down and up from one VID to another (step size of 10 mV).

Figure 5-5. DVS Timing Diagram I (BUCKx\_DECAY = 0)

As shown in Figure 5-6, if a BUCKx\_VID[6:0] is set to 7b000 0000, its output voltage will slew down to the minimum VID value first, and then will drift down to 0 V as the SMPS stops switching. Subsequently, if a BUCKx\_VID[6:0] is set to a value (neither 7b000 0000 nor 7b000 0001) when its output voltage is less than 0.5 V, the VR will ramp up to 0.5 V first with soft-start kicking in, then will slew up to target voltage in the slew rate aforementioned. It must be noted that a fixed 200 μs of soft-start time is reserved for V<sub>OUT</sub> to reach 0.5 V.

Figure 5-6. DVS Timing Diagram II (BUCKx\_DECAY = 0)

### 5.4.4 Decay

In addition to DVS, BUCK1–BUCK6 can decay down to a lower voltage when BUCKx\_DECAY bit in BUCKxCTRL register is set to 1. Decay mode is only used in a downward direction of VID. The VR does not control slew rate. As both high-side and low-side FETs stop switching, the output voltage ramps down naturally, dictated by current drawn from the load and output filtering capacitance. When the VR is in the middle of decay down its PGOOD is masked until  $V_{OUT}$  falls below the over-voltage (OV) threshold of the set VID value. Figure 5-7 shows two cases that differ from each other as to whether  $V_{OUT}$  has reached the target voltage corresponding to a new VID when the VR is commanded to slew back up to a higher voltage. In case that  $V_{OUT}$  has not decayed down below VID as denoted case 2, the VR will wait for VID to catch up, and then  $V_{OUT}$  will start ramping up to keep up with the VID ramp.

Figure 5-7. Decay Down to a Lower  $V_{OUT}$  and Slew Up

Figure 5-8. Decay Down to 0 V and Slew Up

### 5.4.5 Current Limit

The buck controllers (BUCK1, BUCK2, and BUCK6) have inductor-valley current-limit architecture and the current limit is programmable by an external resistor at the ILIMx pin. Equation 1 shows the calculation for a desired resistor value, depending on specific application conditions.  $I_{LIMREF}$  is the current source out of the ILIMx pin that is typically 50  $\mu$ A, and  $R_{DSON}$  is the maximum channel resistance of the low-side FET. The scaling factor is 1.3 to take into account all errors and temperature variations of  $R_{DSON}$ ,  $I_{LIMREF}$ , and  $R_{ILIM}$ . Finally, 8 is another scaling factor associated with  $I_{LIMREF}$ .

$$R_{ILIM} = \frac{R_{DSON} \times 8 \times 1.3 \times \left( I_{LIM} - \frac{I_{ripple(min)}}{2} \right)}{I_{LIMREF}}$$

where

- $I_{LIM}$  is the target current limit. An appropriate margin must be allowed when determining  $I_{LIM}$  from maximum output DC load current.
- $I_{ripple(min)}$  is the minimum peak-to-peak inductor ripple current for a given  $V_{OUT}$ . (1)

$$I_{ripple(min)} = \frac{V_{OUT} (V_{IN(MIN)} - V_{OUT})}{L_{max} \times V_{IN(MIN)} \times f_{sw(max)}}$$

where

- $L_{max}$  is maximum inductance
- $f_{sw(max)}$  is maximum switching frequency
- $V_{IN(MIN)}$  minimum input voltage to the external power stage (2)

The buck converter limit inductor peak current cycle-by-cycle to  $I_{IND\_LIM}$  is specified in Section 4.8.

The current limit circuit also protects against reverse current going back into the low side FET from the load. When operating in Force PWM mode, the inductor current is expected to go negative so it is important to ensure that the  $R_{ILIM}$  value is sufficient to account for this. If operating in PFM, this can be neglected. The equation for Force PWM minimum  $R_{ILIM}$  value is:

$$R_{ILIM} \geq \frac{R_{DSON} \times 8 \times 1.3 \times \left( \frac{I_{ripple(max)}}{2} \right)}{I_{LIMREF}}$$

where

- $I_{ripple(max)}$  is the maximum peak-to-peak inductor ripple current for a given  $V_{OUT}$ . (3)

$$I_{ripple(max)} = \frac{V_{OUT} (V_{IN(MAX)} - V_{OUT})}{L_{min} \times V_{IN(MAX)} \times f_{sw(min)}}$$

where

- $L_{min}$  is minimum inductance
- $f_{sw(min)}$  is minimum switching frequency
- $V_{IN(MAX)}$  maximum input voltage to the external power stage (4)

If  $R_{ILIM}$  is too low for the chosen inductor and voltage conditions, then the ripple current at no load will trigger the negative current limit, forcing the low side FET to turn off. This will eventually result in the output voltage increasing above target regulation point due to irregular duty cycle created by current limit being triggered.

## 5.5 LDOs and Load Switches

### 5.5.1 VTT LDO

Typically powered from the BUCK6 output, the VTT LDO tracks FBVOUT6 and regulates its output to FBVOUT6 / 2. The LDO current limit is OTP dependent, and it is designed specifically to power DDR memory. The LDO core is a transconductance amplifier with large gain, and it drives a current output stage that either sources or sinks current depending on the deviation of the VTTFB pin voltage from the target regulation voltage.

### 5.5.2 LDOA1–LDOA3

The TPS650861 device integrates three general purpose LDOs. LDOA1 is powered from a 5-V supply through the DRV5V\_2\_A1 pin and it can be factory configured to be an Always-On rail (stay on even in case of emergency shutdown) as long as a valid power supply is available at VSYS. See [Table 5-4](#) for LDOA1 output voltage options. LDOA2 and LDOA3 share a power input pin (PVINLDOA2\_A3). The output regulation voltages are set by writing to LDOAx\_VID[3:0] bits (Reg 0x9A, 0x9B, and 0xAE). See [Table 5-5](#) for LDOA2 and LDOA3 output voltage options. LDOA1 is controlled by the LDOA1\_SWB2\_CTRL register.

**Table 5-4. LDOA1 Output Voltage Options**

VID BITS	V <sub>OUT</sub>	VID BITS	V <sub>OUT</sub>	VID BITS	V <sub>OUT</sub>	VID BITS	V <sub>OUT</sub>
0000	1.35	0100	1.8	1000	2.3	1100	2.85
0001	1.5	0101	1.9	1001	2.4	1101	3.0
0010	1.6	0110	2.0	1010	2.5	1110	3.3
0011	1.7	0111	2.1	1011	2.6	1111	Not Used

**Table 5-5. LDOA2 and LDOA3 Output Voltage Options**

VID BITS	V <sub>OUT</sub>	VID BITS	V <sub>OUT</sub>	VID BITS	V <sub>OUT</sub>	VID BITS	V <sub>OUT</sub>
0000	0.70	0100	0.90	1000	1.10	1100	1.30
0001	0.75	0101	0.95	1001	1.15	1101	1.35
0010	0.80	0110	1.00	1010	1.20	1110	1.40
0011	0.85	0111	1.05	1011	1.25	1111	1.50

### 5.5.3 Load Switches

The PMIC features three general-purpose load switches. SWA1 has its own power input pin (PVINSWA1), while SWB1 and SWB2 share one power input pin (PVINSWB1\_B2). All switches have built-in slew rate control during start-up to limit the inrush current.

## 5.6 Power Goods (PGOOD or PG) and GPOs

The device provides information on status of VRs through four GPO pins along with Power Good Status registers defined in [Section 5.11.50](#) and [Section 5.11.51](#). Power Good information of any individual VR and load switch can be assigned to be part of the PGOOD tree as defined from [Section 5.11.40](#) to [Section 5.11.47](#). PGOOD assertion delays are programmable from 0 ms to 15 ms for GPO1, 5 ms to 100 ms for GPO3, and 0 ms to 100 ms for GPO2 and GPO4, respectively, as are defined in [Section 5.11.21](#) and [Section 5.11.34](#).

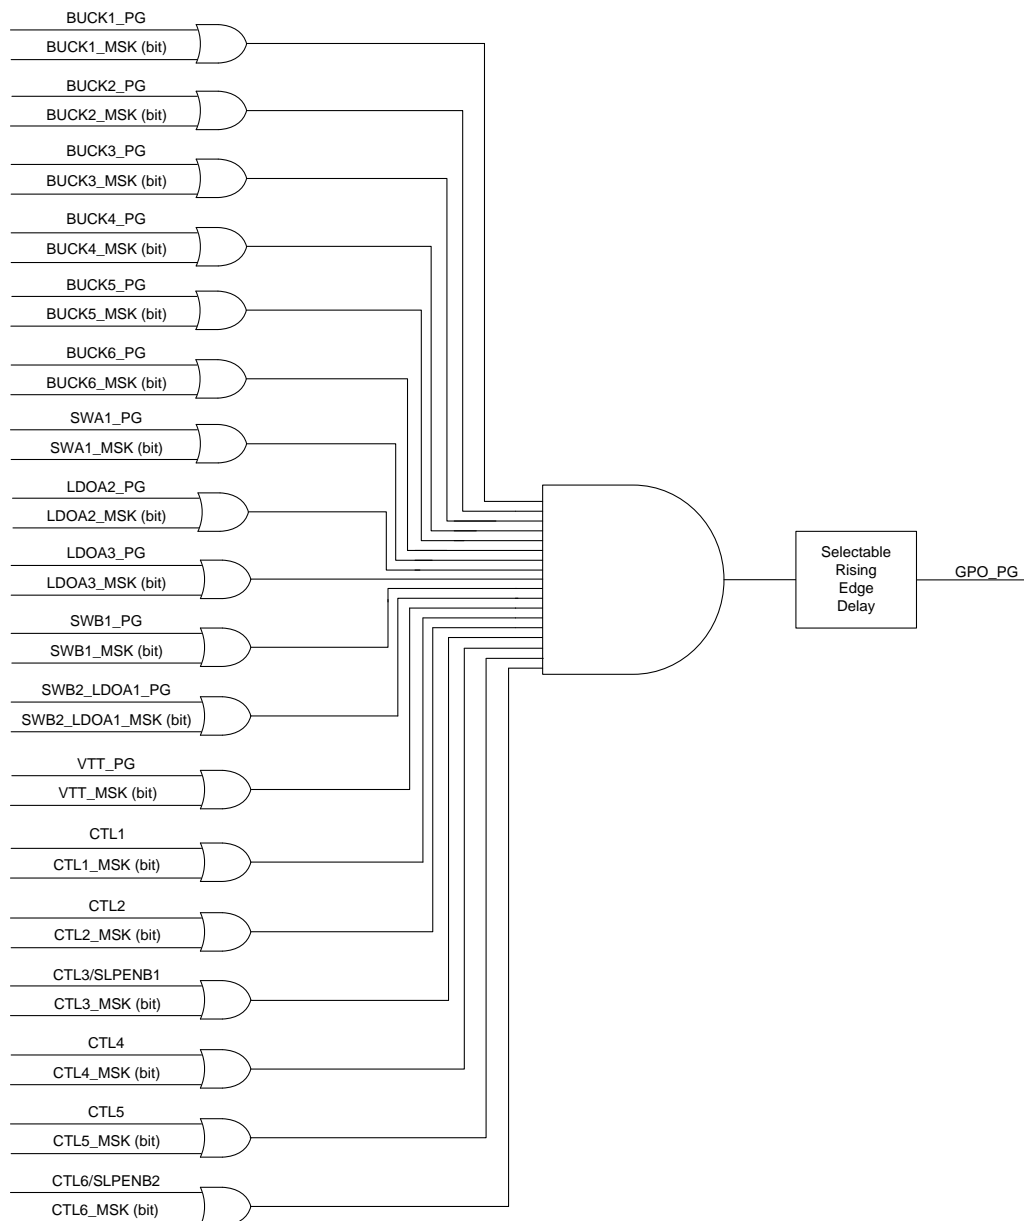

Figure 5-9. Power Good Tree

Alternatively, the GPOs can be used as general purpose outputs controlled by the user through I<sup>2</sup>C. Refer to the [Section 5.11.37](#) for details on controlling the GPOs in I<sup>2</sup>C control mode.

## 5.7 One-Time Programmable Memory

The PMIC has two banks of non-volatile one-time programmable (OTP) memory which stores the default settings for the device. The OTP memory is mapped to corresponding volatile registers which are cleared when VSYS goes below UVLO. When VSYS goes above UVLO, the contents of the OTP memory is loaded into the corresponding volatile registers which are then used to control the PMIC. The OTP is also reloaded in case of any emergency shutdown condition. When programming the PMIC, the values in the volatile registers which have OTP memory equivalents are burned into the OTP.

Some registers do not have OTP equivalent memory. For example, the IRQ register, which indicates which interrupts have been triggered, does not need OTP memory equivalent because its values are always determined after power up. Similarly, the IRQ\_MASK register does not have OTP backing because in order to be useful, the processor needs to communicate with the PMIC to set the masks correctly. There is no need to have a default value other than 1b for these bits. OTP programmable bits are indicated with an 'X' in the register map. Some registers are accessed using I<sup>2</sup>C address 0x5E, which can be changed if necessary using the I2C\_SLAVE\_ADDR register (see [Section 5.12.39](#)). Other registers, which can only be accessed while in programming mode, are accessed using I<sup>2</sup>C address 0x38, which cannot be changed.

The OTP memory settings are set to 1b with a 7 V supply, in a process called "burning". Lower voltages may result in values not being stored or the bit flipping (from 1b to 0b) after some time has passed. To avoid this occurring, the IRQB pin should be probed with an oscilloscope during the prototyping phase of development to ensure it does not drop below 6.7 V during OTP memory burn in. Any bit can be burned from a 0b to a 1b, but once a bit is a 1b, it cannot go back to being a 0b. As a result, it is possible to burn an OTP program and then make minor changes and re-burn the OTP as long as all of the changes are 0b to 1b. For example, if the original OTP program had BUCK3\_VID = 1 V (0011000b) then it can be changed to BUCK3\_VID = 1.15 V (0011110b) without issue since it is just bits 1 and 2 being changed from 0b to 1b. However, if the new desired BUCK3\_VID = 0.9 V (0010100b), then the second bank of OTP would need to be used since bit 3 cannot change from 1b to 0b. The switch from OTP Bank 0 to OTP Bank 1 is permanent as the pointer bit is also OTP.

Detailed information regarding the programming of the non-volatile one-time programmable (OTP) memory is available in the [TPS65086100 OTP Memory Programming Guide](#).

All OTP programmed settings should be validated during prototyping phase to ensure desired functionality because parts cannot be returned in case of incorrect programming. Any issues should be reported to [http://e2e.ti.com/support/power\\_management/pmu/](http://e2e.ti.com/support/power_management/pmu/).

## 5.8 Power Sequencing and VR Control

The device has three different ways of sequencing the rails during power up and power down:

- Rail enabled by CTLx pin
- Rail enabled by Power Good (PG) of previously enabled rail
- Rail enabled by I<sup>2</sup>C software command

A delay can be added from any CTLx pin or PG to the enable of the subjected enabled rail. This creates a very flexible device capable of many sequence options. If a rail cannot be sequenced automatically, any rail can be enabled or disabled through an I<sup>2</sup>C command.

### 5.8.1 CTLx Sequencing

The device has six control-input pins (CTL1–CTL6) to control six SMPS regulators, three LDO regulators, and three load switches. This allows the user to define up to six distinctive groups, to which each VR can be assigned for highly flexible power sequencing. Of the six CTLx pins, CTL3 and CTL6 can be configured alternatively to active-low sleep enable pins. For instance, if a system level SLEEP state is defined such that BUCK1 output regulation voltage is lower than in the normal mode, then BUCK1 SLEEP state can be assigned to CTL3 or CTL6. By being pulled low, either CTL3 or CTL6 can be used to put BUCK1 into SLEEP state, and BUCK1 will regulate its output at a voltage defined by BUCK1\_SLP\_VID[6:0] in [Section 5.11.23](#). For a demonstration of this feature, [Figure 5-10](#) shows how BUCK1 is enabled from the CTL1 pin.

### 5.8.2 PG Sequencing

Any rail can be sequenced by the Power Good of a prior rail. This can be combined with the CTLx method to allow for further sequence control and create more distinctive groups of enables than the six from CTLx. This also allows some of the CTLx pins to be freed up for other purposes such as logic input gates. For a demonstration of this feature, [Figure 5-10](#) shows how the BUCK5 is enabled from the BUCK4 PG.

Figure 5-10. Generic Power-Up Sequence Example

### 5.8.3 Enable Delay

A delay can be added to the enable of any rail after the desired CTLx and PGs are met. This allows for the option to create additional timing groups from either CTLx pins or internal PGs. For a demonstration of this feature, [Figure 5-10](#) shows how BUCK2 and BUCK6 are enabled after BUCK1 is enabled from CTL1 pin.

#### 5.8.4 Power-Up Sequence

When a valid power supply is detected at the VSYS pin as  $V_{SYS}$  crosses above  $V_{SYS\_UVLO\_5V} + V_{SYS\_UVLO+5V\_HYS}$ , the power-up sequence is initiated by driving one of the control input pins high, followed by the rest of pins in order. [Figure 5-10](#) is an example where CTL1–CTL4 are defined to control four groups of VRs, while GPO3 and GPO4 are defined to provide a PGOOD status of two groups. The control input pins do not necessarily have to be pulled up in a staggered manner. For instance, if CTL2 is pulled up from the preceding group of VRs before PGOOD has been asserted at GPO1, the BUCK4 enable will be delayed until the PGOOD is asserted.

#### 5.8.5 Power-Down Sequence

The power-down sequence can follow the CTLx pins, or be controlled with the I<sup>2</sup>C commands. If the internal PGs are used for sequencing or if some rails need to ramp down before others a delay can be added to the deassertion low of the internal enable of the subjected rail. This delay can be independent of the power-up delay option. Thus, power-up and power-down sequences can be different or similar to match the specific application sequences required.

Refer to [Figure 5-11](#) for an example of a power-down sequence demonstrating the delay disable of BUCK1 and BUCK2.

Figure 5-11. Generic Power-Down Sequence Example

### 5.8.6 Sleep State Entry and Exit

Figure 5-12. Sleep State Entry and Exit Sequence Example

Figure 5-12 shows an example where BUCK1 is defined to enter Sleep State in response to CTL6 going low.

**NOTE**

All PGOODs from GPO1–GPO4 can stay asserted during the entry and the exit. Depending on status of the BUCK1\_DECAY bit defined in the BUCK1CTRL register, BUCK1 output will either decay or slew down to a new voltage defined in BUCK1\_SLP\_VID[6:0].

### 5.8.7 Emergency Shutdown

Figure 5-13. Emergency Shutdown Sequence

When  $V_{SYS}$  crosses below  $V_{SYS\_UVLO\_5V}$ , all Power Good pins will be deasserted, and after 444 ns (nom) of delay all VRs will shut down. Upon shutdown, all internal discharge resistors are set to  $100\ \Omega$  to ensure timely decay of all VR outputs. Other conditions that will cause emergency shutdown are the die temperature rising above the critical temperature threshold ( $T_{CRIT}$ ), deassertion of Power Good of any rail (configurable), or failure of any rail to reach power good within 10 ms of being enabled (configurable). If PMIC was shutdown by UVLO, it will wait until  $V_{SYS}$  rises above  $V_{SYS\_UVLO\_5V} + V_{SYS\_UVLO\_5V\_HYS}$  before reloading the default OTP and checking the state of the CTLx pins. If PMIC was shutdown by temperature, it will wait until temperature drops below  $T_{CRIT} - T_{CRIT\_HYS}$  before reloading OTP and checking the state of the CTLx pins. If the PMIC was shutdown by power fault, it will reload OTP after disabling all rails and check the state of the CTLx pins once OTP has finished reloading.

## 5.9 Device Functional Modes

### 5.9.1 Off Mode

When power supply at the VSYS pin is less than  $V_{\text{SYS\_UVLO\_5V}}$  (5.4-V nominal) +  $V_{\text{SYS\_UVLO\_5V\_HYS}}$  (0.2-V nominal), the device is in off mode, where all output rails are disabled. If the supply voltage is greater than  $V_{\text{SYS\_UVLO\_3V}}$  (3.6-V nominal) +  $V_{\text{SYS\_UVLO\_3V\_HYS}}$  (0.15-V nominal) while it is still less than  $V_{\text{SYS\_UVLO\_5V}}$  +  $V_{\text{SYS\_UVLO\_5V\_HYS}}$ , then the internal band-gap reference (VREF pin) along with LDO3P3 are enabled and regulated at target values.

### 5.9.2 Standby Mode

When power supply at the VSYS pin rises above  $V_{\text{SYS\_UVLO\_5V}}$  +  $V_{\text{SYS\_UVLO\_5V\_HYS}}$ , the device enters standby mode, where all internal reference and regulators (LDO3P3 and LDO5) are up and running, and I<sup>2</sup>C interface and CTL pins are ready to respond. All default registers defined in [Section 5.11](#) should have by now been loaded from one-time programmable (OTP) memory. Quiescent current consumption in standby mode is specified in [Section 4.5](#).

### 5.9.3 Active Mode

The device proceeds to active mode when any output rail is enabled either via an input pin as discussed in [Section 5.8](#) or by writing to EN bits through I<sup>2</sup>C. Output regulation voltage can also be changed by writing to VID bits defined in [Section 5.11](#).

## 5.10 I<sup>2</sup>C Interface

The I<sup>2</sup>C interface is a 2-wire serial interface developed by NXP™ (formerly Philips Semiconductor) (see I<sup>2</sup>C-Bus Specification and user manual, Rev 4, 13 February 2012). The bus consists of a data line (SDA) and a clock line (SCL) with pullup structures. When the bus is idle, both SDA and SCL lines are pulled high. All the I<sup>2</sup>C compatible devices connect to the I<sup>2</sup>C bus through open drain I/O pins, DATA and CLK. A master device, usually a microcontroller or a digital signal processor, controls the bus. The master is responsible for generating the SCL signal and device addresses. The master also generates specific conditions that indicate the START and STOP of data transfer. A slave device receives and/or transmits data on the bus under control of the master device.

The PMIC works as a slave and supports the following data transfer modes, as defined in the I<sup>2</sup>C-Bus Specification: standard mode (100 kbps), fast mode (400 kbps), and fast mode plus (1 Mbps). The interface adds flexibility to the power supply solution, enabling most functions to be programmed to new values depending on the instantaneous application requirements. Register contents are loaded when  $V_{\text{SYS}}$  higher than  $V_{\text{SYS\_UVLO\_5V}}$  is applied to the PMIC. The I<sup>2</sup>C interface is running from an internal oscillator that is automatically enabled when there is an access to the interface.

The data transfer protocol for standard and fast modes are exactly the same, therefore, they are referred to as F/S-mode in this document. The protocol for high-speed mode is different from the F/S-mode, and it is referred to as H/S-mode.

The PMIC device supports 7-bit addressing; however, 10-bit addressing and general call address are not supported. The default device address is 0x5E, though it can be modified by programming. The programming registers are located in device address 0x38, which cannot be changed.

### 5.10.1 F/S-Mode Protocol

The master initiates data transfer by generating a start condition. The start condition is when a high-to-low transition occurs on the SDA line while SCL is high (see Figure 5-14). All I<sup>2</sup>C-compatible devices should recognize a start condition.

The master then generates the SCL pulses, and transmits the 7-bit address and the read/write direction bit R/W on the SDA line. During all transmissions, the master ensures that data is valid. A valid data condition requires the SDA line to be stable during the entire high period of the clock pulse (see Figure 5-15). All devices recognize the address sent by the master and compare it to their internal fixed addresses. Only the slave device with a matching address generates an acknowledge (see Figure 5-16), by pulling the SDA line low during the entire high period of the ninth SCL cycle. Upon detecting this acknowledge, the master knows that the communication link with a slave has been established.

The master generates further SCL cycles to either transmit data to the slave (R/W bit = 0) or receive data from the slave (R/W bit = 1). In either case, the receiver needs to acknowledge the data sent by the transmitter. An acknowledge signal can either be generated by the master or by the slave, depending on which one is the receiver. 9-bit valid data sequences consisting of 8-bit data and 1-bit acknowledge can continue as long as necessary.

To signal the end of the data transfer, the master generates a stop condition by pulling the SDA line from low to high while the SCL line is high (see Figure 5-14). This releases the bus and stops the communication link with the addressed slave. All I<sup>2</sup>C-compatible devices must recognize the stop condition. Upon the receipt of a stop condition, all devices know that the bus is released, and they wait for a start condition followed by a matching address.

## 5.11 I<sup>2</sup>C Address: 0x5E Register Maps

### 5.11.1 Register Map Summary

This section describes the registers that can be accessed using I<sup>2</sup>C address 0x5E. These registers can be accessed without putting the device into programming mode. The DEVICEID1 and DEVICEID2 registers can only be written to while the device is in programming mode. The I<sup>2</sup>C address can be changed if necessary from the default 0x5E using the I2C\_SLAVE\_ADDR register (see [Section 5.12.39](#)). See the [TPS65086100 OTP Memory Programming Guide](#) for more information on putting the device into programming mode. Do not attempt to write a RESERVED R/W bit to the opposite value. When the reset value of a bit register is 0bX, it means the bit value is coming from the OTP memory.

**Table 5-6. Register Map Summary**

Address	Name	Short Description
00h	DEVICEID1	Device ID code indicating revision
01h	DEVICEID2	Device ID code indicating revision
02h	IRQ	Interrupt statuses
03h	IRQ_MASK	Interrupt masking
04h	PMIC_STAT	PMIC temperature indicator
05h	SHUTDNSRC	Shutdown root cause indicator bits
20h	BUCK1CTRL	BUCK1 decay control and voltage select
21h	BUCK2CTRL	BUCK2 decay control and voltage select
22h	BUCK3DECAY	BUCK3 decay control
23h	BUCK3VID	BUCK3 voltage select
24h	BUCK3SLPCTRL	BUCK3 voltage select for sleep state
25h	BUCK4CTRL	BUCK4 control
26h	BUCK5CTRL	BUCK5 control
27h	BUCK6CTRL	BUCK6 control
28h	LDOA2CTRL	LDOA2 control
29h	LDOA3CTRL	LDOA3 control
40h	DISCHCTRL1	Discharge resistors for each rail control
41h	DISCHCTRL2	Discharge resistors for each rail control
42h	DISCHCTRL3	Discharge resistors for each rail control
43h	PG_DELAY1	System Power Good on GPO3 (if GPO3 is programmed to be system PG)
91h	FORCESHUTDN	Software force shutdown
92h	BUCK1SLPCTRL	BUCK1 voltage select for sleep state
93h	BUCK2SLPCTRL	BUCK2 voltage select for sleep state
94h	BUCK4VID	BUCK4 voltage select
95h	BUCK4SLPVID	BUCK4 voltage select for sleep state
96h	BUCK5VID	BUCK5 voltage select
97h	BUCK5SLPVID	BUCK5 voltage select for sleep state
98h	BUCK6VID	BUCK6 voltage select
99h	BUCK6SLPVID	BUCK6 voltage select for sleep state
9Ah	LDOA2VID	LDOA2 voltage select
9Bh	LDOA3VID	LDOA3 voltage select
9Ch	BUCK123CTRL	BUCK1, 2, and 3 disable and BUCK1, and 2 PFM/PWM mode control
9Dh	PG_DELAY2	System Power Good on GPO1, 2, and 4 (if GPOs are programmed to be system PG)
9Fh	SWVTT_DIS	SWs and VTT I <sup>2</sup> C disable bits
A0h	I2C_RAIL_EN1	I <sup>2</sup> C Enable control of individual rails
A1h	I2C_RAIL_EN2/GPOCTRL	I <sup>2</sup> C Enable control of individual rails and I <sup>2</sup> C controlled GPOs, high or low
A2h	PWR_FAULT_MASK1	Power fault masking for individual rails

**Table 5-6. Register Map Summary (continued)**

Address	Name	Short Description
A3h	PWR_FAULT_MASK2	Power fault masking for individual rails
A4h	GPO1PG_CTRL1	Power good tree control for GPO1
A5h	GPO1PG_CTRL2	Power good tree control for GPO1
A6h	GPO4PG_CTRL1	Power good tree control for GPO4
A7h	GPO4PG_CTRL2	Power good tree control for GPO4
A8h	GPO2PG_CTRL1	Power good tree control for GPO2
A9h	GPO2PG_CTRL2	Power good tree control for GPO2
AAh	GPO3PG_CTRL1	Power good tree control for GPO3
ABh	GPO3PG_CTRL2	Power good tree control for GPO3
ACH	MISCSYSPG	Power good tree control with CTL3 and CTL6 for GPO
ADh	VTT_DISCH_CTRL	Discharge resistor setting for VTT LDO
Aeh	LDOA1_SWB2_CTRL	LDOA1 and SWB2 control for discharge, voltage selection, and enable
B0h	PG_STATUS1	Power good statuses for individual rails
B1h	PG_STATUS2	Power good statuses for individual rails
B2h	PWR_FAULT_STATUS1	Power fault statuses for individual rails
B3h	PWR_FAULT_STATUS2	Power fault statuses for individual rails
B4h	TEMPCRIT	Critical temperature indicators
B5h	TEMPHOT	Hot temperature indicators

Complex bit access types are encoded to fit into small table cells. [Table 5-7](#) shows the codes that are used for access types in this section.

**Table 5-7. Access Type Codes**

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write

0	SDIETEMP	R	0	PMIC die temperature status. 0: PMIC die temperature is below T <sub>HOT</sub> . 1: PMIC die temperature is above T <sub>HOT</sub> .

### 5.11.7 SHUTDNSRC: PMIC Shut-Down Event Register (offset = 05h) [reset = 0000 0000]

Figure 5-25. SHUTDNSRC Register

Bit	7	6	5	4	3	2	1	0
Bit Name	RESERVED	RESERVED	RESERVED	RESERVED	COLDOFF	UVLO	PWR_FAULT	CRITTEMP
TPS650861	0	0	0	0	0	0	0	0
Access	R	R	R	R	R/W	R/W	R/W	R/W

Table 5-13. SHUTDNSRC Register Descriptions

Bit	Field	Type	Reset	Description
3	COLDOFF	R/W	0	Set by PMIC cleared by host. Host to write 1b to clear. 0: Cleared 1: N/A. Not enabled for existing OTPs.
2	UVLO	R/W	0	Set by PMIC cleared by host. Host to write 1b to clear. 0: Cleared 1: PMIC was shut down due to a UVLO event (V <sub>sys</sub> crosses below 5.4 V). Assertion of this bit sets the SHUTDN bit in <a href="#">Section 5.11.4</a> .
1	PWR_FAULT	R/W	0	Set by PMIC cleared by host. Host to write 1b to clear. 0: Cleared 1: PMIC was shut down due to an unmasked power fault event. Assertion of this bit sets the SHUTDN bit in <a href="#">Section 5.11.4</a> . The source of the power fault can be determined from the PWR_FAULT registers (0xB2 and 0xB3). Overcurrent protection will limit I <sub>OUT</sub> and typically cause a power fault as V <sub>OUT</sub> droops.
0	CRITTEMP	R/W	0	Set by PMIC cleared by host. Host to write 1b to clear. 0: Cleared 1: PMIC was shut down due to the rise of PMIC die temperature above critical temperature threshold (T <sub>CRIT</sub> ). Assertion of this bit sets the SHUTDN bit in <a href="#">Section 5.11.4</a> .

### 5.11.8 BUCK1CTRL: BUCK1 Control Register (offset = 20h) [reset = X]

Figure 5-26. BUCK1CTRL Register

Bit	7	6	5	4	3	2	1	0
Bit Name	BUCK1_ VID[6]	BUCK1_ VID[5]	BUCK1_ VID[4]	BUCK1_ VID[3]	BUCK1_ VID[2]	BUCK1_ VID[1]	BUCK1_ VID[0]	BUCK1_ DECAY
TPS65086100	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 5-14. BUCK1CTRL Register Descriptions

Bit	Field	Type	Reset	Description
7:1	BUCK1_VID[6:0]	R/W	X	This field sets the BUCK1 regulator output regulation voltage in normal mode. See <a href="#">Table 5-2</a> and <a href="#">Table 5-3</a> for 10-mV and 25-mV step ranges for V <sub>OUT</sub> options.
0	BUCK1_DECAY	R/W	X	Decay Bit <b>0:</b> The output slews down to a lower voltage set by the VID bits. <b>1:</b> The output decays down to a lower voltage set by the VID bits. Decay rate depends on total capacitance and load present at the output.

### 5.11.9 BUCK2CTRL: BUCK2 Control Register (offset = 21h) [reset = X]

Figure 5-27. BUCK2CTRL Register

Bit	7	6	5	4	3	2	1	0
Bit Name	BUCK2_ VID[6]	BUCK2_ VID[5]	BUCK2_ VID[4]	BUCK2_ VID[3]	BUCK2_ VID[2]	BUCK2_ VID[1]	BUCK2_ VID[0]	BUCK2_ DECAY

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 5-15. BUCK2CTRL Register Descriptions

Bit	Field	Type	Reset	Description
7:1	BUCK2_VID[6:0]	R/W	X	This field sets the BUCK2 regulator output regulation voltage in normal mode. See <a href="#">Table 5-2</a> and <a href="#">Table 5-3</a> for 10-mV and 25-mV step ranges for V <sub>OUT</sub> options.
0	BUCK2_DECAY	R/W	X	Decay Bit <b>0:</b> The output slews down to a lower voltage set by the VID bits. <b>1:</b> The output decays down to a lower voltage set by the VID bits. Decay rate depends on total capacitance and load present at the output.

### 5.11.10 BUCK3DECAY: BUCK3 Decay Control Register (offset = 22h) [reset = X]

Figure 5-28. BUCK3DECAY Register

Bit	7	6	5	4	3	2	1	0
Bit Name	SPARE	SPARE	SPARE	SPARE	SPARE	SPARE	SPARE	BUCK3_DECAY
TPS65086100	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 5-16. BUCK3DECAY Register Descriptions

Bit	Field	Type	Reset	Description
7:1	SPARE	R/W	X	Unused. Typically mirror BUCK3_VID by default in OTP.
0	BUCK3_DECAY	R/W	X	Decay Bit <b>0:</b> The output slews down to a lower voltage set by the VID bits. <b>1:</b> The output decays down to a lower voltage set by the VID bits. Decay rate depends on total capacitance and load present at the output.

### 5.11.11 BUCK3VID: BUCK3 VID Register (offset = 23h) [reset = X]

Figure 5-29. BUCK3VID Register

Bit	7	6	5	4	3	2	1	0
Bit Name	BUCK3_VID[6]	BUCK3_VID[5]	BUCK3_VID[4]	BUCK3_VID[3]	BUCK3_VID[2]	BUCK3_VID[1]	BUCK3_VID[0]	RESERVED
TPS65086100	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Table 5-17. BUCK3VID Register Descriptions

Bit	Field	Type	Reset	Description
7:1	BUCK3_VID[6:0]	R/W	X	This field sets the BUCK3 regulator output regulation voltage in normal mode. See <a href="#">Table 5-3</a> for 25-mV step ranges for V <sub>OUT</sub> options.

### 5.11.12 BUCK3SLPCTRL: BUCK3 Sleep Control VID Register (offset = 24h) [reset = X]

Figure 5-30. BUCK3SLPCTRL Register

Bit	7	6	5	4	3	2	1	0
Bit Name	BUCK3_SLP_VID[6]	BUCK3_SLP_VID[5]	BUCK3_SLP_VID[4]	BUCK3_SLP_VID[3]	BUCK3_SLP_VID[2]	BUCK3_SLP_VID[1]	BUCK3_SLP_VID[0]	BUCK3_SLP_EN
TPS65086100	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 5-18. BUCK3SLPCTRL Register Descriptions

Bit	Field	Type	Reset	Description
7:1	BUCK3_SLP_VID[6:0]	R/W	X	This field sets the BUCK3 regulator output regulation voltage in sleep mode if BUCK3_SLP_EN = 1b. See <a href="#">Table 5-3</a> for 25-mV step ranges for V <sub>OUT</sub> options.
0	BUCK3_SLP_EN	R/W	X	BUCK3 sleep mode enable. BUCK3 is factory configured to switch to sleep mode voltage either by CTL3/SLPENB1 pin or by CTL6/SLPENB2 pin. <b>0:</b> Disable. Uses BUCK3_VID in all cases. <b>1:</b> Enabled. Uses BUCK3_SLP_VID when assigned sleep pin is low.

### 5.11.13 BUCK4CTRL: BUCK4 Control Register (offset = 25h) [reset = X]

Figure 5-31. BUCK4CTRL Register

Bit	7	6	5	4	3	2	1	0
Bit Name	RESERVED	RESERVED	BUCK4_SLP_EN[1]	BUCK4_SLP_EN[0]	RESERVED	RESERVED	BUCK4_MODE	BUCK4_DIS
TPS65086100	0	0	0	0	1	1	0	0
Access	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 5-19. BUCK4CTRL Register Descriptions

Bit	Field	Type	Reset	Description
5:4	BUCK4_SLP_EN	R/W	X	BUCK4 sleep mode enable. BUCK4 is factory configured to switch to sleep mode voltage either by CTL3/SLPENB1 pin or by CTL6/SLPENB2 pin. <b>00:</b> Disable. Uses BUCK4_VID in all cases. <b>11:</b> Enabled. Uses BUCK4_SLP_VID when assigned sleep pin is low. <b>01,10:</b> Reserved. Do not write these values.
3:2	RESERVED	R/W	11	Reserved bits. Always write to 11.
1	BUCK4_MODE	R/W	X	This field sets the BUCK4 regulator operating mode. <b>0:</b> Reserved <b>1:</b> Forced PWM mode
0	BUCK4_DIS	R/W	X	BUCK4 Disable Bit. Writing 0 to this bit forces BUCK4 to turn off regardless of any control input pin (CTL1–CTL6) status. <b>0:</b> Disable <b>1:</b> Enable

### 5.11.14 BUCK5CTRL: BUCK5 Control Register (offset = 26h) [reset = X]

Figure 5-32. BUCK5CTRL Register

Bit	7	6	5	4	3	2	1	0
Bit Name	RESERVED	RESERVED	BUCK5_SLP_EN[1]	BUCK5_SLP_EN[0]	RESERVED	RESERVED	BUCK5_MODE	BUCK5_DIS

Access	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 5-20. BUCK5CTRL Register Descriptions

Bit	Field	Type	Reset	Description
5:4	BUCK5_SLP_EN	R/W	X	BUCK5 sleep mode enable. BUCK5 is factory configured to switch to sleep mode voltage either by CTL3/SLPENB1 pin or by CTL6/SLPENB2 pin. <b>00</b> : Disable. Uses BUCK5_VID in all cases. <b>11</b> : Enabled. Uses BUCK5_SLP_VID when assigned sleep pin is low. <b>01,10</b> : Reserved. Do not write these values.
3:2	RESERVED	R/W	11	Reserved bits. Always write to 11.
1	BUCK5_MODE	R/W	X	This field sets the BUCK5 regulator operating mode. <b>0</b> : Reserved <b>1</b> : Forced PWM mode
0	BUCK5_DIS	R/W	X	BUCK5 Disable Bit. Writing 0 to this bit forces BUCK5 to turn off regardless of any control input pin (CTL1–CTL6) status. <b>0</b> : Disable. <b>1</b> : Enable.

### 5.11.15 BUCK6CTRL: BUCK6 Control Register (offset = 27h) [reset = X]

Figure 5-33. BUCK6CTRL Register

Bit	7	6	5	4	3	2	1	0
Bit Name	RESERVED	RESERVED	BUCK6_SLP_EN[1]	BUCK6_SLP_EN[0]	RESERVED	RESERVED	BUCK6_MODE	BUCK6_DIS
TPS65086100	0	0	0	0	1	1	0	0
Access	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 5-21. BUCK6CTRL Register Descriptions

Bit	Field	Type	Reset	Description
5:4	BUCK6_SLP_EN	R/W	X	BUCK6 sleep mode enable. BUCK6 is factory configured to switch to sleep mode voltage either by CTL3/SLPENB1 pin or by CTL6/SLPENB2 pin. <b>00</b> : Disable. Uses BUCK6_VID in all cases. <b>11</b> : Enabled. Uses BUCK6_SLP_VID when assigned sleep pin is low. <b>01,10</b> : Reserved. Do not write these values.
3:2	RESERVED	R/W	11	Reserved bits. Always write to 11.
1	BUCK6_MODE	R/W	X	This field sets the BUCK6 regulator operating mode. <b>0</b> : Automatic mode <b>1</b> : Forced PWM mode
0	BUCK6_DIS	R/W	X	BUCK6 Disable Bit. Writing 0 to this bit forces BUCK6 to turn off regardless of any control input pin (CTL1–CTL6) status. <b>0</b> : Disable. <b>1</b> : Enable.

### 5.11.16 LDOA2CTRL: LDOA2 Control Register (offset = 28h) [reset = X]

Figure 5-34. LDOA2CTRL Register

Bit	7	6	5	4	3	2	1	0
Bit Name	RESERVED	RESERVED	LDOA2_SLP_EN[1]	LDOA2_SLP_EN[0]	RESERVED	RESERVED	RESERVED	LDOA2_DIS
TPS65086100	0	0	0	0	1	1	0	0
Access	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 5-22. LDOA2CTRL Register Descriptions

Bit	Field	Type	Reset	Description
5:4	LDOA2_SLP_EN	R/W	X	LDOA2 sleep mode enable. LDOA2 is factory configured to switch to sleep mode voltage either by CTL3/SLPENB1 pin or by CTL6/SLPENB2 pin. <b>00</b> : Disable. Uses LDOA2_VID in all cases. <b>11</b> : Enabled. Uses LDOA2_SLP_VID when assigned sleep pin is low. <b>01,10</b> : Reserved. Do not write these values.
3:1	RESERVED	R/W	110	Reserved bits. Always write to '110'.
0	LDOA2_DIS	R/W	X	LDOA2 Disable Bit. Writing 0 to this bit forces LDOA2 to turn off regardless of any control input pin (CTL1–CTL6) status. <b>0</b> : Disable. <b>1</b> : Enable.

### 5.11.17 LDOA3CTRL: LDOA3 Control Register (offset = 29h) [reset = X]

Figure 5-35. LDOA3CTRL Register

Bit	7	6	5	4	3	2	1	0
Bit Name	RESERVED	RESERVED	LDOA3_SLP_EN[1]	LDOA3_SLP_EN[0]	RESERVED	RESERVED	RESERVED	LDOA3_DIS

### 5.11.21 PG\_DELAY1: 1st Power Good Delay Register (offset = 43h) [reset = X]

Programmable Power Good delay for GPO3 pin, measured from the moment when all VRs assigned to GPO3 pin reach their regulation range to Power Good assertion. This is an optional register as the PMIC can be programmed for system PG, level shifter or I<sup>2</sup>C controller GPO.

**Figure 5-39. PG\_DELAY1 Register**

Bit	7	6	5	4	3	2	1	0
Bit Name	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	GPO3_PG_DELAY[2]	GPO3_PG_DELAY[1]	GPO3_PG_DELAY[0]
TPS65086100	0	0	0	0	0	0	0	0
Access	R	R	R	R	R	R/W	R/W	R/W

**Table 5-27. PG\_DELAY1 Register Descriptions**

Bit	Field	Type	Reset	Description
2:0	GPO3_PG_DELAY[2:0]	R/W	X	Programmable delay Power Good or level shifter for GPO3 pin. Measured from the moment when all rails grouped to this pin reach their regulation range. All values have ±10% variation. <b>000</b> : 2.5 ms <b>001</b> : 5.0 ms <b>010</b> : 10 ms <b>011</b> : 15 ms <b>100</b> : 20 ms <b>101</b> : 50 ms <b>110</b> : 75 ms <b>111</b> : 100 ms —: Bits not used. If GPO3 is controlled by I <sup>2</sup> C rather than PG and is not used internally for VTT LDO enable, these bits have no impact. Default is set to 0b.

### 5.11.22 FORCESHUTDN: Force Emergency Shutdown Control Register (offset = 91h) [reset = 0000 0000]

**Figure 5-40. FORCESHUTDN Register**

Bit	7	6	5	4	3	2	1	0
Bit Name	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	RESERVED	SDWN
TPS650861	0	0	0	0	0	0	0	0
Access	R	R	R	R	R	R	R	R/W

**Table 5-28. FORCESHUTDN Register Descriptions**

Bit	Field	Type	Reset	Description
0	SDWN	R/W	0	Forces reset of the PMIC and reset of all registers. The bit is self-clearing. PMIC does not generate I <sup>2</sup> C ACK for this command because it goes into emergency shutdown. <b>0:</b> No action. <b>1:</b> PMIC initiates emergency shutdown.

### 5.11.23 BUCK1SLPCTRL: BUCK1 Sleep Control Register (offset = 92h) [reset = X]

**Figure 5-41. BUCK1SLPCTRL Register**

Bit	7	6	5	4	3	2	1	0
Bit Name	BUCK1_SLP_VID[6]	BUCK1_SLP_VID[5]	BUCK1_SLP_VID[4]	BUCK1_SLP_VID[3]	BUCK1_SLP_VID[2]	BUCK1_SLP_VID[1]	BUCK1_SLP_VID[0]	BUCK1_SLP_EN

Bit	Field	Type	Reset	Description
7:4	LDOA3_SLP_VID[3:0]	R/W	X	This field sets the LDOA3 regulator output regulation voltage in sleep mode. See Table 5-5 for $V_{out}$ options.
3:0	LDOA3_VID[3:0]	R/W	X	This field sets the LDOA3 regulator output regulation voltage in normal mode. See Table 5-5 for $V_{out}$ options.

### 5.11.33 BUCK123CTRL: BUCK1-3 Control Register (offset = 9Ch) [reset = X]

Figure 5-51. BUCK123CTRL Register

Bit	7	6	5	4	3	2	1	0
Bit Name	RESERVED	RESERVED	BUCK3_MODE	BUCK2_MODE	BUCK1_MODE	BUCK3_DIS	BUCK2_DIS	BUCK1_DIS
TPS65086100	0	0	0	0	0	0	0	0
Access	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 5-39. BUCK123CTRL Register Descriptions

Bit	Field	Type	Reset	Description
5	BUCK3_MODE	R/W	X	This field sets the BUCK3 regulator operating mode. <b>0:</b> Reserved <b>1:</b> Forced PWM mode
4	BUCK2_MODE	R/W	X	This field sets the BUCK2 regulator operating mode. <b>0:</b> Automatic mode <b>1:</b> Forced PWM mode
3	BUCK1_MODE	R/W	X	This field sets the BUCK1 regulator operating mode. <b>0:</b> Automatic mode <b>1:</b> Forced PWM mode
2	BUCK3_DIS	R/W	X	BUCK3 Disable Bit. Writing 0 to this bit forces BUCK3 to turn off regardless of any control input pin (CTL1–CTL6) status. <b>0:</b> Disable <b>1:</b> Enable
1	BUCK2_DIS	R/W	X	BUCK2 Disable Bit. Writing 0 to this bit forces BUCK2 to turn off regardless of any control input pin (CTL1–CTL6) status. <b>0:</b> Disable <b>1:</b> Enable
0	BUCK1_DIS	R/W	X	BUCK1 Disable Bit. Writing 0 to this bit forces BUCK1 to turn off regardless of any control input pin (CTL1–CTL6) status. <b>0:</b> Disable <b>1:</b> Enable

### 5.11.34 PG\_DELAY2: 2nd Power Good Delay Register (offset = 9Dh) [reset = X]

Programmable Power Good delay for GPO1, GPO2, and GPO4 pins, measured from the moment when all VRs assigned to respective GPO reach their regulation range to Power Good assertion. This is an optional register as the PMIC can be programmed for system PG, level shifter or I<sup>2</sup>C controller GPO.

**Figure 5-52. PG\_DELAY2 Register**

Bit	7	6	5	4	3	2	1	0
Bit Name	GPO2_PG_DELAY[2]	GPO2_PG_DELAY[1]	GPO2_PG_DELAY[0]	GPO4_PG_DELAY[2]	GPO4_PG_DELAY[1]	GPO4_PG_DELAY[0]	GPO1_PG_DELAY[1]	GPO1_PG_DELAY[0]
TPS65086100	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**Table 5-40. PG\_DELAY2 Register Descriptions**

Bit	Field	Type	Reset	Description
7:5	GPO2_PG_DELAY[2:0]	R/W	X	Programmable delay Power Good or level shifter for GPO2 pin. Measured from the moment when all rails grouped to this pin reach their regulation range. All values have $\pm 10\%$ variation. <b>000</b> : 0 ms <b>001</b> : 5.0 ms <b>010</b> : 10 ms <b>011</b> : 15 ms <b>100</b> : 20 ms <b>101</b> : 50 ms <b>110</b> : 75 ms <b>111</b> : 100 ms —: Bits not used. If GPO2 is controlled by I <sup>2</sup> C rather than PG and is not used internally for VTT LDO enable, these bits have no impact. Default is set to 0b.
4:2	GPO4_PG_DELAY[2:0]	R/W	X	Programmable delay Power Good or level shifter for GPO4 pin. Measured from the moment when all rails grouped to this pin reach their regulation range. All values have $\pm 10\%$ variation. <b>000</b> : 0 ms <b>001</b> : 5.0 ms <b>010</b> : 10 ms <b>011</b> : 15 ms <b>100</b> : 20 ms <b>101</b> : 50 ms <b>110</b> : 75 ms <b>111</b> : 100 ms —: Bits not used. If GPO4 is controlled by I <sup>2</sup> C rather than PG, these bits have no impact. Default is set to 0b.
1:0	GPO1_PG_DELAY[1:0]	R/W	X	Programmable delay Power Good or level shifter for GPO1 pin. Measured from the moment when all rails grouped to this pin reach their regulation range. All values have $\pm 10\%$ variation. <b>00</b> : 0 ms <b>01</b> : 5.0 ms <b>10</b> : 10 ms <b>11</b> : 15 ms —: Bits not used. If GPO1 is controlled by I <sup>2</sup> C rather than PG, these bits have no impact. Default is set to 0b.

### 5.11.35 SWVTT\_DIS: SWVTT Disable Register (offset = 9Fh) [reset = X]

Figure 5-53. SWVTT\_DIS Register

Bit	7	6	5	4	3	2	1	0
Bit Name	SWB2_LDO A1_DIS	SWB1_DIS	SWA1_DIS	VTT_DIS	Reserved	Reserved	Reserved	Reserved

0	BUCK1_OC	R/W	0	BUCK1 LSD FET overcurrent has been detected. 0: Not asserted. 1: Asserted. The host to write 1 to clear.

**5.12 I<sup>2</sup>C Address: 0x38 Register Maps**

**5.12.1 Register Map Summary**

This section describes the registers that can be accessed using I<sup>2</sup>C address 0x38. These registers can only be accessed by putting the device into programming mode. See the [TPS65086100 OTP Memory Programming Guide](#) for more information on putting the device into programming mode. It is recommended to use the OTP generator tool to make changes to these OTP settings. Do not attempt to write a RESERVED R/W bit to the opposite value. When the reset value of a bit register is 0bX, it means the bit value is coming from the OTP memory.

**NOTE**

There are additional registers not shown that are set by the OTP generator tool.

**Table 5-64.**

Address	Name	Short Description
02h	OTP_CTRL1	OTP control register for programming.
03h	OTP_CTRL2	OTP control register for selecting OTP bank.
07h	BUCK1_CTRL_EN1	BUCK1 enable control register 1.
08h	BUCK1_CTRL_EN2	BUCK1 enable control register 2.
09h	BUCK1_CTRL_EN3	BUCK1 enable control register 3.
0Ah	BUCK2_CTRL_EN1	BUCK2 enable control register 1.
0Bh	BUCK2_CTRL_EN2	BUCK2 enable control register 2.
0Ch	BUCK2_CTRL_EN3	BUCK2 enable control register 3.
0Dh	BUCK3_CTRL_EN1	BUCK3 enable control register 1.
0Eh	BUCK3_CTRL_EN2	BUCK3 enable control register 2.
0Fh	BUCK3_CTRL_EN3	BUCK3 enable control register 3.
10h	BUCK4_CTRL_EN1	BUCK4 enable control register 1.
11h	BUCK4_CTRL_EN2	BUCK4 enable control register 2.

**Table 5-64. (continued)**

Address	Name	Short Description
12h	BUCK4_CTRL_EN3	BUCK4 enable control register 3.

## 6 Applications, Implementation, and Layout

---

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

---

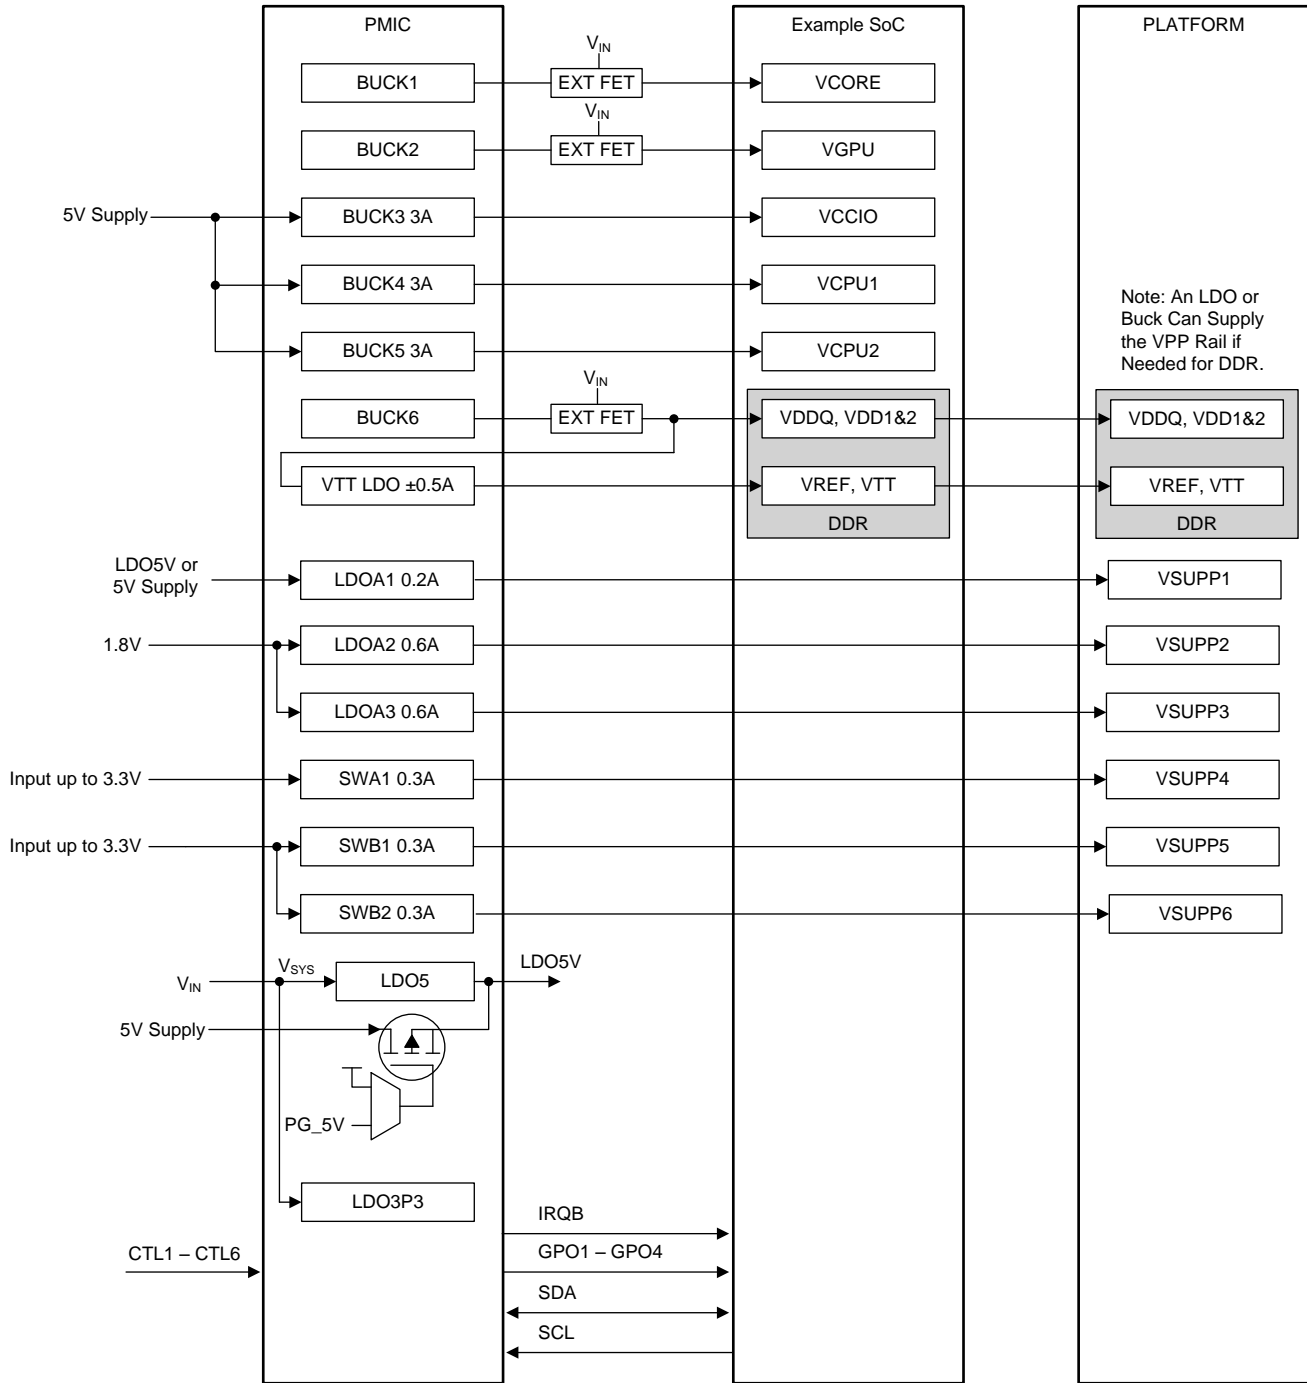

### 6.1 Application Information

For a detailed description about application usage, refer to the [TPS65086x Design Guide](#) and to the [TPS65086x Schematic and Layout Checklist](#).

### 6.2 Typical Application

#### 6.2.1 Typical Application Example

This section describes the general application information and provides a more detailed description on the PMIC that powers a generic multicore-processor application. An example system block diagram for the device powering an SoC and the rest of platform is shown in [Figure 6-1](#). The functional block diagram in [Figure 5-1](#) outlines the typical external components necessary for proper device functionality.

Copyright © 2017, Texas Instruments Incorporated

Figure 6-1. Typical Application Example

### 6.2.1.1 Design Requirements

The PMIC requires decoupling caps on the supply pins. Follow the values for recommended capacitance on these supplies given in [Section 4](#). The controllers, converter, LDOs, and some other features can be adjusted to meet specific application needs. [Section 6.2.1.2](#) describes how to design and adjust the external components to achieve desired performance.

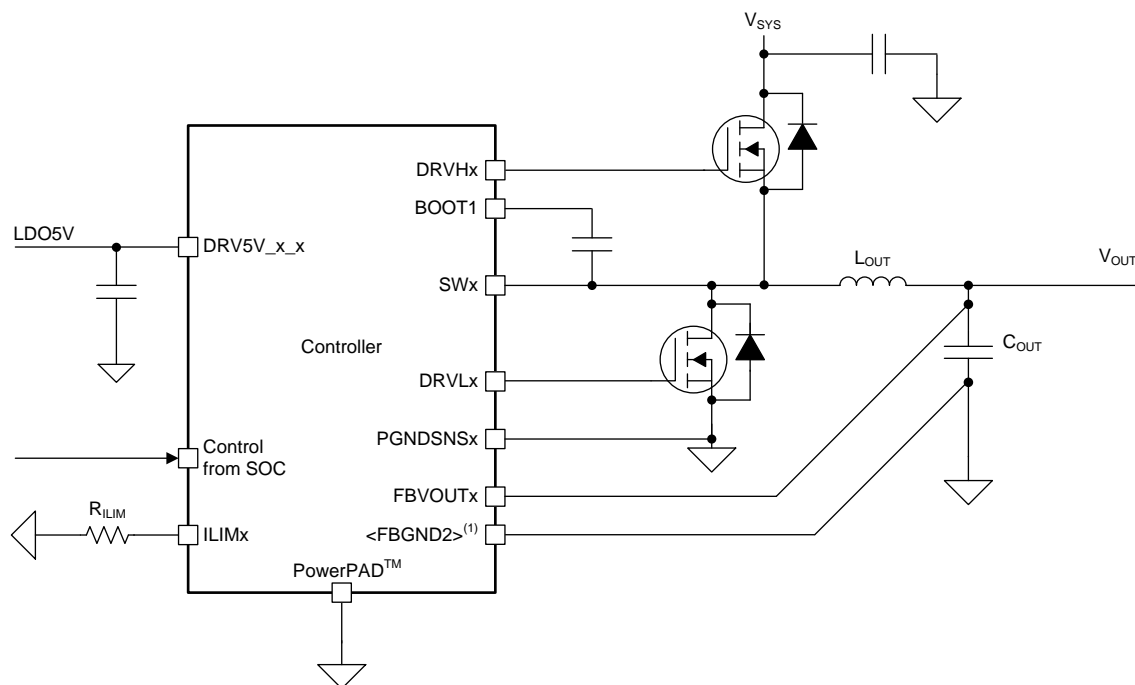

### 6.2.1.2 Detailed Design Procedure

#### 6.2.1.2.1 Controller Design Procedure

Designing the controller can be broken down into the following steps:

1. Design the output filter
2. Select the FETs
3. Select the bootstrap capacitor
4. Select the input capacitors
5. Set the current limits

Controllers BUCK1, BUCK2, and BUCK6 require a 5-V supply and capacitors at their corresponding DRV5V\_x\_x pins. For most applications, the DRV5V\_x\_x input should come from the LDO5P0 pin to ensure uninterrupted supply voltage; a 2.2- $\mu$ F, X5R, 20%, 10-V, or similar capacitor must be used for decoupling.

Copyright © 2017, Texas Instruments Incorporated

(1) <FBGND2> is only present for BUCK2.

Figure 6-2. Controller Diagram

### 6.2.1.2.1.1 Selecting the Inductor

Placement of an inductor is required between the external FETs and the output capacitors. Together, the inductor and output capacitors make the double-pole that contributes to stability. In addition, the inductor is directly responsible for the output ripple, efficiency, and transient performance. As the inductance used increases, the ripple current decreases, which typically results in an increased efficiency. However, with an increase in inductance used, the transient performance decreases. Finally, the inductor selected must be rated for appropriate saturation current, core losses, and DC resistance (DCR).

Equation 5 shows the calculation for the recommended inductance for the controller.

$$L = \frac{V_{OUT} \times (V_{IN} - V_{OUT})}{V_{IN} \times f_{sw} \times I_{OUT(MAX)} \times K_{IND}}$$

where

- $V_{OUT}$  is the typical output voltage
- $V_{IN}$  is the typical input voltage
- $f_{sw}$  is the typical switching frequency when loaded, 1 MHz unless otherwise noted
- $I_{OUT(MAX)}$  is the maximum load current
- $K_{IND}$  is the ratio of  $I_{L(ripple)}$  to the  $I_{OUT(MAX)}$ . For this application, TI recommends that  $K_{IND}$  is set to a value from 0.2 to 0.4. Higher values have improved transient performance, lower values have improved efficiency

(5)

With the chosen inductance value, the peak current for the inductor in steady state operation,  $I_{L(max)}$ , can be calculated using Equation 6. The rated saturation current of the inductor must be higher than the  $I_{L(max)}$  current.

$$I_{L(MAX)} = I_{OUT(MAX)} + \frac{(V_{IN} - V_{OUT}) \times V_{OUT}}{2 \times V_{IN} \times f_{sw} \times L}$$

(6)

### 6.2.1.2.1.2 Selecting the Output Capacitors

TI recommends using ceramic capacitors with low ESR values to provide the lowest output voltage ripple. The output capacitor requires an X7R or an X5R dielectric. Y5V and Z5U dielectric capacitors, aside from their wide variation in capacitance over temperature, become resistive at high frequencies.

At light load currents, the controller operates in PFM mode, and the output voltage ripple is dependent on the output-capacitor value and the PFM peak inductor current. Higher output-capacitor values minimize the voltage ripple in PFM mode. To achieve specified regulation performance and low output voltage ripple, the DC-bias characteristic of ceramic capacitors must be considered. The effective capacitance of ceramic capacitors drops with increasing DC bias voltage.

TI recommends the use of small ceramic capacitors placed between the inductor and load with many vias to the PGND plane for the output capacitors of the BUCK controllers. This solution typically provides the smallest and lowest cost solution available for D-CAP2 controllers.

The selection of the output capacitor is typically driven by the output transient response. Equation 7 and Equation 8 provide a rough estimate of the minimum required capacitance to ensure proper transient response. Because the transient response is significantly affected by the board layout, some experimentation is expected in order to confirm that values derived in this section are applicable to any particular use case. These are not meant to be an absolute requirement, but rather a rough starting point. Alternatively, some known combination values from which to begin are provided in Table 6-1.  $V_{UNDER}$  and  $V_{OVER}$  values should be greater than or equal to 3% of  $V_{OUT}$  setting in order for equations to be meaningful. The equations provide some margin so that actual capacitance requirement may be lower than calculated.

$$C_{OUT} > \frac{I_{TRAN(MAX)}^2 \times L}{(V_{IN} - V_{OUT}) \times V_{UNDER}}$$

where

- $I_{\text{TRAN(max)}}$  is the maximum load current step
- $L$  is the chosen inductance
- $V_{\text{IN}}$  is the maximum input voltage
- $V_{\text{OUT}}$  is the minimum programmed output voltage
- $V_{\text{UNDER}}$  is the maximum allowable undershoot from programmed voltage

$$C_{\text{OUT}} > \frac{I_{\text{TRAN(MAX)}}^2 \times L}{V_{\text{OUT}} \times V_{\text{OVER}}}$$

where

- $V_{\text{OVER}}$  is the maximum allowable overshoot from programmed voltage

Another key performance factor can be the ripple voltage while in pulsed frequency modulation mode, also known as discontinuous conduction mode. At light load, the controller will disable the low side FET once it detects a zero-crossing event on the inductor current. It will stay disabled until  $V_{\text{OUT}}$  crosses below the set VID threshold. This architecture allows significant power savings at light load conditions by minimizing power loss through the low side FET and through switching. The disadvantage is that there is higher voltage ripple since the ripple current is only positive. Additionally, for even higher efficiency,  $T_{\text{ON(PFM)}}$  for this device is typically 80% longer than  $T_{\text{ON(PWM)}}$ , which can be calculated by dividing the duty cycle by the switching frequency. An estimate for the required capacitance for a given allowable ripple voltage at light load is shown in [Equation 9](#). ESR of the output capacitor is neglected here because ceramic capacitors, which typically have low ESR, are recommended.  $V_{\text{OVER}}$  should not be set lower than 3% of  $V_{\text{OUT}}$  value.

$$C_{\text{OUT}} > \frac{T_{\text{ON\_EXT}}^2 \times V_{\text{OUT}} \times (V_{\text{IN}} - V_{\text{OUT}})}{2 \times V_{\text{IN}} \times f_{\text{SW}}^2 \times V_{\text{OVER}} \times L}$$

where

- $T_{\text{ON\_EXT}}$  is the PFM on time extension constant, 1.8 unless otherwise noted in the part number specific section
- $V_{\text{OUT}}$  is the maximum programmed output voltage
- $V_{\text{IN}}$  is the maximum input voltage
- $f_{\text{SW}}$  is the typical switching frequency when loaded, 1 MHz unless otherwise noted
- $V_{\text{OVER}}$  is the maximum allowable overshoot from programmed voltage
- $L$  is the chosen inductance

In cases where the transient current change is very low and ripple voltage allowance is large, the DC stability may become important. DCAP2 is a very stable architecture so this value is likely to be the smallest of those calculated. [Equation 10](#) approximates the amount of capacitance necessary to maintain DC stability. Again, this is provided as a starting point; actual values will vary on a board-to-board case.

$$C_{\text{OUT}} > \frac{V_{\text{OUT}} \times 50 \mu\text{s}}{V_{\text{IN}} \times f_{\text{SW}} \times L}$$

where

- $V_{\text{OUT}}$  is the maximum programmed output voltage
- 50  $\mu\text{s}$  is based on internal ramp setup
- $V_{\text{IN}}$  is the minimum input voltage
- $f_{\text{SW}}$  is the typical switching frequency
- $L$  is the chosen inductance

Choosing the maximum value between [Equation 7](#), [Equation 8](#), [Equation 9](#), and [Equation 10](#) is recommended as a starting point to get the desired performance. All equations are estimates and have not been validated at all variable corners. Removing excess capacitance or adding extra capacitance may be necessary during board evaluation. Testing can typically be performed on the evaluation module or on prototype boards.

**Table 6-1. Known LC Combinations for 1  $\mu$ s Load Rise and Fall Time**

$I_{\text{TRAN(max)}} (A)$	$L (\mu H)$	$V_{\text{OUT}} (V)$	$V_{\text{UNDER}} (V)$	$V_{\text{OVER}} (V)$	$C_{\text{OUT}}(\mu F)$
3.5	0.47	1	0.05	0.05	110
4	0.47	1	0.05	0.05	220
5	0.47	1.35	0.068	0.068	220
8	0.33	1	0.05	0.06	440
20	0.22	1	0.05	0.16	550

### 6.2.1.2.1.3 Selecting the FETs

This controller is designed to drive two NMOS FETs. Typically, lower  $R_{\text{DS(on)}}$  values are better for improving the overall efficiency of the controller, however higher gate charge thresholds will result in lower efficiency so the two need to be balanced for optimal performance. As the  $R_{\text{DS(on)}}$  for the low-side FET decreases, the minimum current limit increases; therefore, ensure selection of the appropriate values for the FETs, inductor, output capacitors, and current limit resistor. TI's [CSD85301Q2](#), [CSD87331Q3D](#), [CSD87381P](#), [CSD87588N](#), and [CSD87350Q5D](#) devices are recommended for the controllers, depending on the required maximum current.

### 6.2.1.2.1.4 Bootstrap Capacitor

To ensure the internal high-side gate drivers are supplied with a stable low-noise supply voltage, a capacitor must be connected between the SWx pins and the respective BOOTx pins. TI recommends placing ceramic capacitors with the value of 0.1  $\mu$ F for the controllers. During testing, a 0.1- $\mu$ F, size 0402, 10-V capacitor is used for the controllers.

TI recommends reserving a small resistor in series with the bootstrap capacitor in case the turnon and turnoff of the FETs must be slowed to reduce voltage ringing on the switch node, which is a common practice for controller design.

### 6.2.1.2.1.5 Setting the Current Limit

The current-limiting resistor value must be chosen based on [Equation 1](#).

### 6.2.1.2.1.6 Selecting the Input Capacitors

Due to the nature of the switching controller with a pulsating input current, a low ESR input capacitor is required for best input-voltage filtering and also for minimizing the interference with other circuits caused by high input-voltage spikes. For the controller, a typical 2.2- $\mu$ F capacitor can be used for the DRV5V\_x\_x pin to handle the transients on the driver. For the FET input, 10  $\mu$ F of input capacitance (after derating) is recommended for most applications. To achieve the low ESR requirement, a ceramic capacitor is recommended. However, the voltage rating and DC-bias characteristic of ceramic capacitors must be considered. For better input-voltage filtering, the input capacitor can be increased without any limit.

#### NOTE

Use the correct value for the ceramic capacitor capacitance after derating to achieve the recommended input capacitance.

TI recommends placing a ceramic capacitor as close as possible to the FET across the respective VSYS and PGND pins of the FETs. The preferred capacitors for the controllers are two Murata GRM21BR61E226ME44: 22- $\mu$ F, 0805, 25-V,  $\pm 20\%$ , or similar capacitors.

### 6.2.1.2.2 Converter Design Procedure

Designing the converter has only two steps: design the output filter and select the input capacitors.

[Figure 6-3](#) shows a diagram of the converter.

Copyright © 2017, Texas Instruments Incorporated

**Figure 6-3. Converter Diagram**

#### 6.2.1.2.2.1 Selecting the Inductor

Internal parameters for the converters are optimized for either a 0.47  $\mu\text{H}$  or 1  $\mu\text{H}$  inductor, however it is possible to use other inductor values as long as they are chosen carefully and thoroughly tested. The equations from [Section 6.2.1.2.1.1](#) can be utilized again with the parameters changed to match those of the converters. Switching frequency estimates can be found in [Section 4.15](#).

#### 6.2.1.2.2.2 Selecting the Output Capacitors

Ceramic capacitors with low ESR values are recommended because they provide the lowest output voltage ripple. The output capacitor requires either an X7R or X5R rating. Y5V and Z5U capacitors, aside from the wide variation in capacitance over temperature, become resistive at high frequencies.

For the output capacitors of the BUCK converters, TI recommends placing small ceramic capacitors between the inductor and load with many vias to the PGND plane. This solution typically provides the smallest and lowest-cost solution available.

The minimum output capacitance recommended is 22  $\mu\text{F}$  for stability. [Equation 7](#) and [Equation 8](#) can be used to estimate the required output capacitance for a given load transient. Note that  $V_{\text{IN}}$  will be different for the converters and that the switching frequency can be estimated using [Section 4.15](#). [Equation 9](#) can be neglected for converters as there is no on time extension and the  $V_{\text{IN}} - V_{\text{OUT}}$  term is typically smaller.

#### 6.2.1.2.2.3 Selecting the Input Capacitors

Due to the nature of the switching converter with a pulsating input current, a low ESR input capacitor is required for best input-voltage filtering and for minimizing the interference with other circuits caused by high input-voltage spikes. For the PVINx pin, 2.5  $\mu\text{F}$  of input capacitance (after derating) is required for most applications. A ceramic capacitor is recommended to achieve the low ESR requirement. However, the voltage rating and DC-bias characteristic of ceramic capacitors must be considered. The input capacitor can be increased without any limit for better input-voltage filtering.

#### NOTE

Use the correct value for the ceramic capacitor capacitance after derating to achieve the recommended input capacitance.

The preferred capacitor for the converters is one Samsung CL05A106MP5NUNC: 10- $\mu\text{F}$ , 0402, 10-V,  $\pm 20\%$ , or similar capacitor.

### 6.2.1.2.3 LDO Design Procedure

The VTT LDO must handle the fast load transients from the DDR memory for termination. Therefore, it is recommended to use ceramic capacitors to maintain a high amount of capacitance with low ESR on the VTT LDO outputs and inputs. The preferred output capacitors for the VTT LDO are the GRM188R60J226MEA0 from Murata (22  $\mu$ F, 0603, 6.3 V,  $\pm$ 20%, or similar capacitors). The preferred input capacitor for the VTT LDO is the CL05A106MP5NUNC from Samsung (10- $\mu$ F, 0402, 10-V,  $\pm$ 20%, or similar capacitor).

The remaining LDOs must have input and output capacitors chosen based on the values in [Section 4.9](#).

### 6.2.1.3 Application Curves

### 6.2.1.4 Layout

#### 6.2.1.4.1 Layout Guidelines

For a detailed description regarding layout recommendations, refer to the [TPS65086x Design Guide](#) and to the [TPS65086x Schematic and Layout Checklist](#). For all switching power supplies, the layout is an important step in the design, especially at high peak currents and high switching frequencies. If the layout is not carefully done, the regulator can have stability problems and EMI issues. Therefore, use wide and short traces for the main current path and for the power ground tracks. The input capacitors, output capacitors, and inductors must be placed as close as possible to the device. Use a common-ground node for power ground and use a different, isolated node for control ground to minimize the effects of ground noise. Connect these ground nodes close to the AGND pin by one or two vias. Use of the design guide is highly encouraged in addition to the following list of other basic requirements:

- Do **not** allow the AGND, PGNDNSx, or FBGND2 to connect to the thermal pad on the top layer.
- To ensure proper sensing based on FET  $R_{DS(on)}$ , PGNDNSx must not connect to PGND until very close to the PGND pin of the FET.
- All inductors, input and output capacitors, and FETs for the converters and controller must be on the same board layer as the IC.
- To achieve the best regulation performance, place feedback connection points near the output capacitors and minimize the control feedback loop as much as possible.

- Bootstrap capacitors must be placed close to the device.
- The internal reference regulators must have their input and output capacitors placed close to the device pins.
- Route DRVHx and SWx as a differential pair. Ensure that there is a PGND path routed in parallel with DRVLx, which provides optimal driver loops.

#### 6.2.1.4.2 Layout Example

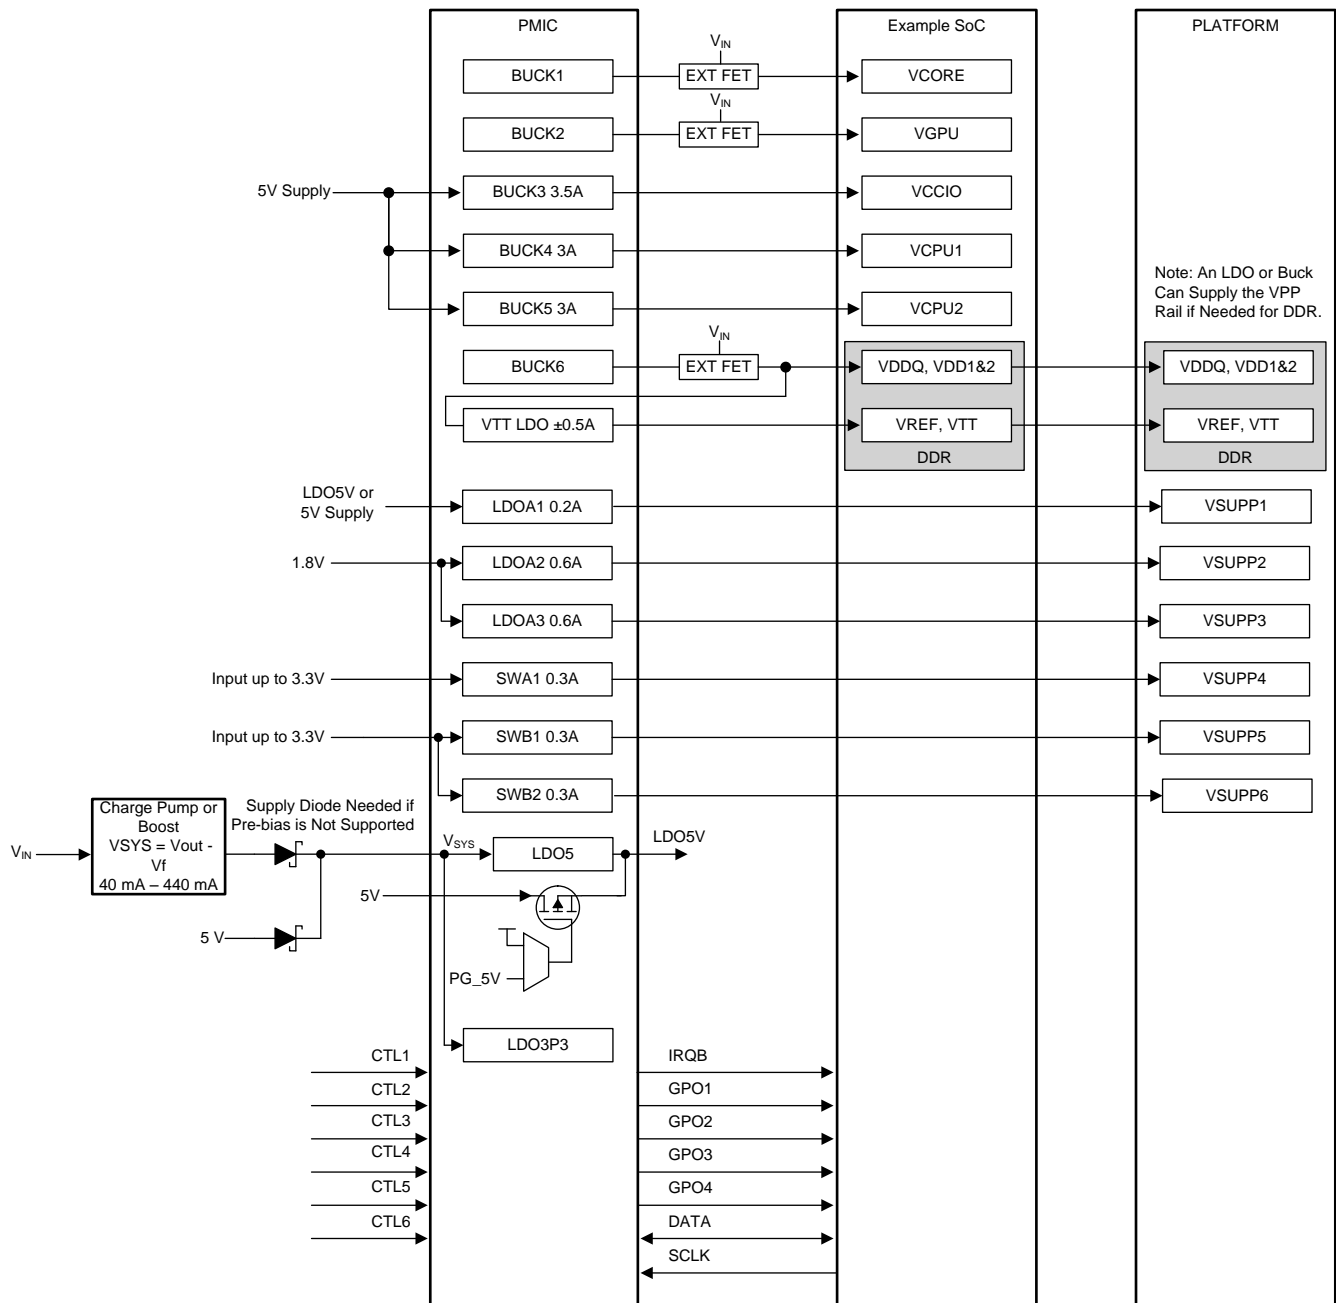

Figure 6-6. EVM Layout Example With All Components on the Top Layer

### 6.2.2 VIN 5-V Application

The PMIC can be operated by a 5-V input voltage to the system because the power path of the controller does not go through the device itself. The concept is simple: supply the controller VINs with the 5-V input, and supply the VSYS with a 5.8-V step-up of the 5 V with a boost or charge pump. The 5.8 V is recommended because the UVLO of the internal LDO5 is at 5.6 V and the device measures the voltage at VSYS and determines the optimum internal compensation and controller settings thus, it is ideal the VSYS be close to the VIN of the controllers.

Copyright © 2017, Texas Instruments Incorporated

Figure 6-7. VIN 5-V Application

### 6.2.2.1 Design Requirements

The PMIC requires a step-up voltage from the 5-V input to 5.8 V for the VSYS supply. TI recommends keeping the VSYS near 5.8 V for optimization of the controllers.

Depending on the application use cases, the supply current to the VSYS can require from 40 mA with the drivers being supplied by the 5-V input to 440 mA with the drivers being supplied by the LDO5 and the LDOA1 being operated at max loading. This means that a charge pump may be used in some applications like the 5-V input but in others, a small boost may be required.

A Schottky diode from the 5-V input to the VSYS is recommended to ensure the VSYS is biased and the internal reference LDOs are on before the step-up regulator is enabled or fully ramped up. If the step-up cannot tolerate pre-bias condition then, 2 diodes may be needed to prevent the initial 5-V supply biasing the output of the step-up.

### 6.2.2.2 Design Procedure

To design a 5-V input application, first provide a step-up voltage from the 5-V input to the VSYS. Design the step-up to output a voltage near 5.8 V. Next, route the 5-V input to the controller and converter VINs. Thus, all power paths (*all high currents*) are routed through the controllers or directly to the converters. None of the high currents are required from the step-up supply. After the input stage is complete, the rest of the system can be designed as normal following the typical application procedure, using 5 V as the input value to the controllers.

### 6.2.2.3 Application Curves

### 6.3 Power Supply Coupling and Bulk Capacitors

This device is designed to work with several different input voltages. The minimum voltage on the VSYS pin is 5.6 V for the device to start up; however, this is a low power rail. The input to the FETs must be from 4.5 V to 21 V as long as the proper BOM choices are made. Input to the converters should be between 3.3 V and 5 V. For the device to output maximum power, the input power must be sufficient. For the controllers, VIN must be able to supply sufficient input current for the output power of the application. For the converters, PVINx must be able to typically supply 2 A.

A best practice here is to determine power usage by the system and back-calculate the necessary power input based on expected efficiency values.

### 6.4 Do's and Don'ts

- Connect the LDO5V output to the DRV5V\_x\_x inputs for situations where an external 5-V supply is not initially available or is not available the entire time PMIC is on. If the external 5-V supply is always present, then DRV5V\_x\_x can be directly connected to remove the V5ANA-to-LDO5P0 load switch  $R_{\text{DSON}}$ .
- Ensure that none of the control pins are potentially floating.
- Include 0- $\Omega$  resistors on the DRVH or BOOT pins of controllers on prototype boards, which allows for slowing the controllers if the system is unable to handle the noise generated by the large switching or if switching voltage is too large due to layout.
- Do **not** connect the V5ANA power input to a different source other than PVINx. A mismatch here causes reference circuits to regulate incorrectly.
- Do **not** supply the V5ANA power input before the VSYS. Reference biasing of the internal FETs may turn on the HS FET passing the input to the output until VSYS is biased.
- Do **not** change the values of the reserved bits when writing I<sup>2</sup>C. This can have unexpected consequences. Expected values for each OTP are shown in the register map.

### 7.4 社区资源

下列链接提供到 TI 社区资源的连接。链接的内容由各个分销商“按照原样”提供。这些内容并不构成 TI 技术规范，并且不一定反映 TI 的观点；请参阅 TI 的 [《使用条款》](#)。

**TI E2E™ 在线社区** 为了促进工程师之间的合作，我们创建了 TI 工程师对工程师 (E2E) 社区。在 [e2e.ti.com](http://e2e.ti.com) 中，您可以提问、分享知识、拓展思路并与同行工程师一道帮助解决问题。

**设计支持** **TI** 参考设计支持 可帮助您快速查找有帮助的 E2E 论坛、设计支持工具以及技术支持的联系信息。

### 7.5 商标

D-CAP2, D-CAP, NexFET, E2E are trademarks of Texas Instruments.

NXP is a trademark of NXP Semiconductors.

All other trademarks are the property of their respective owners.

## 7.6 静电放电警告

ESD 可能会损坏该集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理措施和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

## 7.7 术语表

**TI 术语表** 这份术语表列出并解释术语、缩写和定义。

## 8 机械、封装和可订购信息

以下页面包含机械、封装和可订购信息。这些信息是指定器件的最新可用数据。数据如有变更，恕不另行通知，且不会对此文档进行修订。如需获取此数据表的浏览器版本，请查阅左侧的导航栏。

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS65086100RSKR	ACTIVE	VQFN	RSK	64	2000	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 85	T65086100 PG1.0	
TPS65086100RSKT	ACTIVE	VQFN	RSK	64	250	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 85	T65086100 PG1.0	

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**TAPE AND REEL INFORMATION**

# MECHANICAL DATA

RSK (S-PVQFN-N64)

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5-1994.
  - B. This drawing is subject to change without notice.
  - C. QFN (Quad Flatpack No-Lead) Package configuration.
  - D. The package thermal pad must be soldered to the board for thermal and mechanical performance.
  - E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.

# THERMAL PAD MECHANICAL DATA

RSK (S-PVQFN-N64)

PLASTIC QUAD FLATPACK NO-LEAD

## THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

Bottom View

Exposed Thermal Pad Dimensions

4208001-5/H 08/14

NOTE: A. All linear dimensions are in millimeters

RSK (S-PVQFN-N64)

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- All linear dimensions are in millimeters.
  - This drawing is subject to change without notice.
  - This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SCBA017, SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>.
  - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
  - Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for any larger diameter vias placed in the thermal pad.

## 重要声明和免责声明

TI“按原样”提供技术和可靠性数据（包括数据表）、设计资源（包括参考设计）、应用或其他设计建议、网络工具、安全信息和其他资源，不保证没有瑕疵且不做任何明示或暗示的担保，包括但不限于对适销性、某特定用途方面的适用性或不侵犯任何第三方知识产权的暗示担保。
