

FEATURES

- Fully compatible with the ISO 11898 standard
- Thermally protected
- Input levels compatible with 3.3 V and 5 V devices
- Transmit Data (TXD) dominant time-out function
- Very low-current standby mode with remote wake-up Capability via the bus: 5µA Typical
- Transceiver in unpowered state disengages from the bus (zero load)
- At least 110 nodes can be connected
- High speed (up to 1 MBaud)
- Very low Electro Magnetic Emission (EME)
- Provide DFN3*3-8, Small Outline, Leadless Package

DESCRIPTION

The TJA1040 is the interface between the Controller Area Network (CAN) protocol controller and the physical bus. It is primarily intended for high-speed applications, up to 1 MBaud, in in-vehicle, industry control and other fields. The device provides differential transmit capability to the bus and differential receive capability to the CAN controller.

ADDITIONAL DESCRIPTION

1 Sketch

The TJA1040 is the interface between the Controller Area Network (CAN) protocol controller and the physical bus, and can be applied to the fields of in-vehicle and industrial control etc. It is primarily intended for high-speed applications, up to 1 Mbaud, in passenger cars. The device provides differential transmit capability to the bus and differential receive capability to the CAN controller, and fully compatible with the ISO 11898 standard.

2 Current protection

A current-limiting circuit protects the transmitter output stage from damage caused by accidental short-circuit to either positive or negative supply voltage, although power dissipation increases during this fault condition.

3 Fail-safe features

Pin TXD provides a pull-up towards VCC in order to force a recessive level in case pin TXD is unpowered. Pin STB provides a pull-up towards VCC in order to force the transceiver into standby mode in case pin STB is unpowered.

In the case that the VCC is lost, pins TXD, STB and RXD will become floating to prevent reverse supplying conditions via these pins.

4 Over temperature protection

The output drivers are protected against over-temperature conditions. If the virtual junction temperature exceeds the shutdown junction temperature $T_{j(sd)}$, the output drivers will be disabled until the virtual junction temperature becomes lower than $T_{j(sd)}$ and TXD becomes recessive again.

By including the TXD condition, the occurrence of output driver oscillation due to temperature drifts is avoided.

5 TXD dominant time-out function

A 'TXD dominant time-out' timer circuit prevents the bus lines from being driven to a permanent dominant state (blocking all network communication) if pin TXD is forced permanently LOW by a hardware and/or software application failure. The timer is triggered by a negative edge on pin TXD.

If the duration of the LOW level on pin TXD exceeds the internal timer value (t_{dom}), the transmitter is disabled, driving the bus lines into a recessive state. The timer is reset by a positive edge on pin TXD.

6 Operating modes

The TJA1040 provides two modes of operation which are selectable via pin STB:

High-speed mode and standby mode.
