74VHC9541FT

1. Functional Description

- Octal Universal Schmitt Buffer with 3-State Outputs

2. General

The 74VHC9541FT is an ultra-high-speed octal Schmitt buffer fabricated using silicon-gate CMOS technology. The 74VHC9541FT combines low power consumption of CMOS with Schottky TTL speeds.

The outputs can be put in the high-impedance state by placing a logic HIGH on the Enable ($\overline{G}$) input. The CONT input determines the logical inversion of data. A logic LOW on the CONT input configures the 74VHC9541FT as an inverter; a logic HIGH on the CONT input configures the 74VHC9541FT as a buffer.

All the inputs have hysteresis between the positive-going and negative-going thresholds. Thus the 74VHC9541FT is capable of squaring up transitions of slowly changing input signals and provides an improved noise immunity. Additionally, all the inputs have a newly developed protection circuit without a diode returned to V_{CC}. This enables the inputs to be tolerant of up to 5 volts even when power supply is down. The input power-down protection capability makes the 74VHC9541FT ideal for a wide range of applications, such as interfacing between different voltages, voltage translation from 5 V to 3 V and battery back-up circuits.

Note: Exceeding any of the absolute maximum ratings, even briefly, lead to deterioration in IC performance or even destruction.
Using continuously under heavy loads (e.g. the application of high temperature/current/voltage and the significant change in temperature, etc.) may cause this product to decrease in the reliability significantly even if the operating conditions (i.e. operating temperature/current/voltage, etc.) are within the absolute maximum ratings and the operating ranges.
Please design the appropriate reliability upon reviewing the Toshiba Semiconductor Reliability Handbook (“Handling Precautions”/“Derating Concept and Methods”) and individual reliability data (i.e. reliability test report and estimated failure rate, etc).

Note 1: 180 mW in the range of T_a = -40 to 85 °C. From T_a = 85 to 125 °C a derating factor of -3.25 mW/°C shall be applied until 50 mW.
