## TC7USB42MU

## 1. Functional Description

- Dual SPDT USB Switch

## 2. General

The TC7USB42MU is high-speed CMOS dual 1-2 multiplexer/demultiplexer. The low ON-resistance and the low capacitance of the switch allow connections to USB2.0 ( 480 Mbps ) application.
This device consists of dual individual two-inputs multiplexer/demultiplexer with common select input (S) and output enable ( $\overline{\mathrm{OE}}$ ). The $\mathrm{D}+/ \mathrm{D}^{-}$inputs is connected to the $1 \mathrm{D}+/ 1 \mathrm{D}$ - or $2 \mathrm{D}+/ 2 \mathrm{D}^{-}$outputs determined by the combination both the select input (S) and output enable ( $\overline{\mathrm{OE}}$ ). When the output enable $(\overline{\mathrm{OE}})$ input is held high level, the switches are open with regardless the state of select inputs and a high-impedance state exists between the switches.
All inputs are equipped with protection circuits against static discharge.

Note: Exceeding any of the absolute maximum ratings, even briefly, lead to deterioration in IC performance or even destruction.
Using continuously under heavy loads (e.g. the application of high temperature/current/voltage and the significant change in temperature, etc.) may cause this product to decrease in the reliability significantly even if the operating conditions (i.e. operating temperature/current/voltage, etc.) are within the absolute maximum ratings and the operating ranges.
Please design the appropriate reliability upon reviewing the Toshiba Semiconductor Reliability Handbook ("Handling Precautions"/"Derating Concept and Methods") and individual reliability data (i.e. reliability test report and estimated failure rate, etc).
