2. Thermal details and lifetime

2.1 Expected lifetime

Expected lifetime

850 mA	tc	50 °C	55 °C	65 °C	
	Lifetime	100,000 h	100,000 h	65,000 h	

The LED driver is designed for a lifetime stated above under reference conditions and with a failure probability of less than 10 %.

The relation of tc to ta temperature depends also on the luminaire design. If the measured tc temperature is approx. 5 K below tc max., ta temperature should be checked and eventually critical components (e.g. ELCAP) measured. Detailed information on request.

3. Installation / wiring

3.1 Circuit diagram

Device with loop through wiring function.

3.2 Wiring type and cross section

For wiring use stranded wire with ferrules or solid wire from 0.75–1.5 mm<sup>2</sup> (mains wires) and 0.2–1.5 mm<sup>2</sup> (secondary wires, LED module). Strip 8.5–9.5 mm of insulation from the cables to ensure perfect operation of the push-wire terminals. Use one wire for each terminal connector only.

Input terminal (D2):

Output terminal (D1):

3.3 Loose wiring

Press down the “push button” and remove the cable from front.

3.4 Fixing conditions

Dry, acidfree, oilfree, fatfree. It is not allowed to exceed the maximum ambient temperature (ta) stated on the device. Minimum distances stated below are recommendations and depend on the actual luminaire. Is not suitable for fixing in corner.

The LED module and all contact points within the wiring must be sufficiently insulated against 3 kV surge voltage.

**3.5 Wiring guidelines**

- All connections must be kept as short as possible to ensure good EMI behaviour.
- Mains leads should be kept apart from LED driver and other leads (ideally 5 – 10 cm distance)
- Max. length of output wires is 2 m.
- To comply with the EMC regulations run the secondary wires (LED module) in parallel.
- Incorrect wiring can damage LED modules.
- To avoid the damage of the Driver, the wiring must be protected against short circuits to earth (Sharp edged metal parts, metal cable clips, louver, etc.).
- The current selection has to be installed in the accordance to the requirement of low voltage installation.
- Through wiring of mains is for connecting additional LED driver only. Max. permanent current of 2 A may not be exceeded.

**3.6 Replace LED module**

1. Mains off
2. Remove LED module
3. Wait for 20 seconds
4. Connect LED module again

Hot plug-in or output switching of LEDs is not permitted and may cause a very high current to the LEDs.

**3.7 Current setting**

 Set the current by DIP switch after mains off. Use of DIP switch only after mains off.

**700 mA:** Switch 1 = Off, Switch 2 = Off

**750 mA:** Switch 1 = On, Switch 2 = Off

**800 mA:** Switch 1 = Off, Switch 2 = On

**850 mA:** Switch 1 = On, Switch 2 = On

**3.8 Mounting of device**

Max. torque for fixing: 0.5 Nm/M4

**4. Electrical values**

Test at 230 V 50 Hz.

**4.1 Efficiency vs load**

**4.2 Power factor vs load**

**4.3 THD vs load**

THD without harmonic < 5 mA (0.6 %) of the input current:

## 5. Functions

### 5.1 Short-circuit behaviour

In case of a short circuit on the output side (LED) the LED driver switches off. After elimination of the short-circuit fault the LED driver will recover automatically.

### 5.2 No-load operation

The LED driver works in burst working mode to provide a constant output voltage regulation which allows the application to be able to work safely when LED string opens due to a failure.

### 5.3 Overload protection

If the maximum load is exceeded by a defined internal limit, the LED driver will protect itself and LED may flicker. After elimination of the overload, the nominal operation is restored automatically.

### 5.4 Over temperature protection

The LED driver is protected against temporary thermal overheating. If the temperature limit is exceeded, the output current will reduce or LED may flicker. It will recover automatically.

## 6. Miscellaneous

### 6.1 Disposal of equipment

Return old devices in accordance with the WEEE directive to suitable recycling facilities.

### 6.2 Insulation and electric strength testing of luminaires

Electronic devices can be damaged by high voltage. This has to be considered during the routine testing of the luminaires in production.

According to IEC 60598-1 Annex Q (informative only!) or ENEC 303-Annex A, each luminaire should be submitted to an insulation test with 500 V<sub>DC</sub> for 1 second. This test voltage should be connected between the interconnected phase and neutral terminals and the earth terminal. The insulation resistance must be at least 2 M $\Omega$ .

As an alternative, IEC 60598-1 Annex Q describes a test of the electrical strength with 1500 V<sub>AC</sub> (or 1.414 x 1500 V<sub>DC</sub>). To avoid damage to the electronic devices this test must not be conducted.

### 6.3 Conditions of use and storage

Humidity: 5 % up to max. 85 %,  
not condensed  
(max. 56 days/year at 85 %)

Storage temperature: -40 °C up to max. +80 °C

The devices have to be within the specified temperature range (ta) before they can be operated.

### 6.4 Maximum number of switching cycles

All LED driver are tested with 50,000 switching cycles.
