## TRIDONIC

## LED driver

Linear dimming

## Driver LCA 85W 600-1800mA DT8 Ip PRE

Tunable White DT8 premium SELV series

## Product description

- Dimmable built-in constant current 2-channel LED driver with DALI-2 DT8
- Dimming range 3 - 100 \%
- Suitable for luminaires of protection class I and protection class II
- Adjustable output current between 600 and $1,800 \mathrm{~mA}$ for each channel
- Max. output power 85 W
- Up to $90 \%$ efficiency
- Power input on stand-by < 0.5 W
- Nominal lifetime up to $100,000 \mathrm{~h}$
- 5 years guarantee (conditions at www.tridonic.com)

## Housing properties

- Low profile metal casing with white cover
- Type of protection IP20

## Interfaces

- one4all (DALI-2 DT8, DSI, switchDIM, corridorFUNCTION V2)
- colourSWITCH
- Terminal blocks: $0^{\circ}$ push terminals

## Functions

- Adjustable output current in 1-mA-steps (DALI) or with resistor plug (I-SELECT 2)
- Constant light output function (CLO)
- colourSWITCH with predefined colours
- switchDIM and colourSWITCH with memory function
- Power-up fading and fade2zero
- Configurable via DALI
- Protective features (overtemperature, short-circuit, overload, no-load, reduced surge amplification)
- Intelligent Voltage Guard (overvoltage and undervoltage monitoring)
- Suitable for emergency lighting acc. to EN 50172

## Benefits

- Flexible configuration via companionSUITE
- Application-oriented operating window for max. compatibility
- Best energy savings due to low stand-by losses
- Flexible configuration via DALI and I-SELECT 2

## Typical applications

- For linear/area lighting in office and health care applications
- Tunable white application

[^0]${ }^{2}$ (2) Depending on the selected output current.
${ }^{3}$ Depending on the DALI traffic at the interface
${ }^{4}$ The table only lists a number of possible operating points but does not cover each single point. The output current can be set within the total value range in 1 -mA-steps.
${ }^{5}$ Not compatible with I-SELECT (generation 1). Calculated resistor value
${ }^{\text {© }}$ Output current is mean value.
${ }^{8}$ Valid for immediate change of power supply type otherwise the starting time is valid.

## Product description

- Ready-for-use resistor to set output current value
- Compatible with LED driver featuring I-SELECT 2 interface; not compatible with I-SELECT (generation 1)
- Resistor is base insulated
- Resistor power 0.25 W
- Current tolerance $\pm 2 \%$ additional to output current tolerance
- Compatible with LED driver series PRE and EXC

## Example of calculation

- $\mathrm{R}[\mathrm{k} \Omega$ ] $=5 \mathrm{~V} / \mathrm{I}$ _out [mA] $\times 1000$
- E96 resistor value used
- Resistor value tolerance $\leq 1 \%$; resistor power $\geq 0.1 \mathrm{~W}$;
base insulation necessary
- When using a resistor value beyond the specified range, the output current will automatically be set to the minimum value (resistor value too big), respectively to the maximum value (resistor value too small)

|  |  | Lifetime | >100,000 h | $>100,000 \mathrm{~h}$ | > 100,000 h | >100,000 h | 70,000 h |
|  | >1,200 - 1,500 mA | tc | $70^{\circ} \mathrm{C}$ | $74{ }^{\circ} \mathrm{C}$ | $78{ }^{\circ} \mathrm{C}$ | $83^{\circ} \mathrm{C}$ | - |
|  |  | Lifetime | >100,000 h | > 100,000 h | 70,000 h | 50,000 h | - |
|  | >1,500-1,800 mA | tc | $74{ }^{\circ} \mathrm{C}$ | $78{ }^{\circ} \mathrm{C}$ | $83^{\circ} \mathrm{C}$ | - | - |
|  |  | Lifetime | 90,000 h | 60,000 h | 50,000 h | - | - |

The LED driver is designed for a lifetime stated above under reference conditions and with a failure probability of less than $10 \%$.
The relation of tc to ta temperature depends also on the luminaire design.
If the measured tc temperature is approx. 5 K below tc max., ta temperature should be checked and eventually critical components (e.g. ELCAP) measured. Detailed information on request.

## 3. Installation / wiring

### 3.1 Circuit diagram

Wiring diagram for emergency

### 3.2 Wiring type and cross section

Solid wire with a cross section of $0.5-1.5 \mathrm{~mm}^{2}$. Strip $8-9 \mathrm{~mm}$ of insulation from the cables to ensure perfect operation of terminals.

LED module/LED driver/supply

3.3 Loose wiring

Loosen wire through twisting
and pulling or using a $\varnothing 1 \mathrm{~mm}$
release tool

### 3.4 Wiring guidelines

- Run the secondary lines separately from the mains connections and lines to achieve good EMC performance.
- The max. secondary cable length is 2 m ( 4 m circuit), this applies for LED output as well as for I-SELECT 2.
- For good EMC performance, keep the LED wiring as short as possible.
- Secondary switching is not permitted.
- The LED driver has no inverse-polarity protection on the secondary side. Wrong polarity can damage LED modules with no inverse-polarity protection.
- Wrong wiring of the LED driver can lead to malfunction or irreparable damage.
- In case of protection class II applications it's recommended to separate the lamp wires of the different channels. Depending onto the luminaire construction additional actions, such as equipotential connection between driver and LED or a toroidal ferrite at the lamp wires are recommended.
- To avoid the damage of the Driver, the wiring must be protected against short circuits to earth (sharp edged metal parts, metal cable clips, louver, etc.).

### 3.5 Hot plug-in

Hot plug-in is not supported due to residual output voltage of $>0 \mathrm{~V}$.
If a LED load is connected the device has to be restarted before the output will be activated again.
This can be done via mains reset or via interface (DALI, DSI, switchDIM).

### 3.6 Earth connection

The earth connection is conducted as protection earth (PE). The LED driver can be earthed via earth terminal or metal housing. If the LED driver will be earthed, protection earth (PE) has to be used. There is no earth connection required for the functionality of the LED driver.
Earth connection is recommended to improve following behaviour:

- Electromagnetic interferences (EMI)
- LED glowing at stand-by
- Transmission of mains transients to the LED output

In general it is recommended to earth the LED driver if the LED module is mounted on earthed luminaire parts respectively heat sinks and thereby representing a high capacity against earth.

### 3.7 I-SELECT 2 resistors connected via cable

For details see:
http://www.tridonic.com/com/en/download/technical/LCA_PRE_LC_EXC_ProductManual_en.pdf.

## 4. Electrical values

### 4.1 Operating window

——— Operating window $100 \%$
----------- Operating window dimmed

Make sure that the LED driver is operated within the given window under all operating conditions. Special attention needs to be paid at dimming and DC emergency operation as the forward voltage of the connected LED modules varies with the dimming level, due to the implemented amplitude dimming technology. Coming below the specified minimum output voltage of the LED driver may cause the device to shut-down.
See chapter "6.9 Light level in DC operation" for more information.
4.2 Efficiency vs load

4.3 Power factor vs load

4.4 THD vs load

100 \% load corresponds to the max. output power (full load) according to the table on page 2.

## LED driver

Linear dimming

### 4.5 Maximum loading of automatic circuit breakers in relation to inrush current

| Automatic circuit breaker type | C10 | C13 | C16 | C20 | B10 | B13 | B16 | B20 | Inrush current |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Installation $\varnothing$ | $1.5 \mathrm{~mm}^{2}$ | $1.5 \mathrm{~mm}^{2}$ | $2.5 \mathrm{~mm}^{2}$ | $4 \mathrm{~mm}^{2}$ | $1.5 \mathrm{~mm}^{2}$ | $1.5 \mathrm{~mm}^{2}$ | $2.5 \mathrm{~mm}^{2}$ | $4 \mathrm{~mm}^{2}$ | $\mathrm{I}_{\text {max }}$ | time |
| LCA 85W 600-1800mA DT8 Ip PRE | 15 | 20 | 25 | 32 | 9 | 12 | 15 | 19 | 31.5 A | 215 ¢s |

These are max. values calculated out of inrush current! Please consider not to exceed the maximum rated continuous current of the circuit breaker. Calculation uses typical values from ABB series S 200 as a reference.
Actual values may differ due to used circuit breaker types and installation environment.
4.6 Harmonic distortion in the mains supply (at $230 \mathrm{~V} / 50 \mathrm{~Hz}$ and full load) in \%

### 4.7 Dimming

Dimming range 3 \% to 100 \%
Digital control with:

- DSI signal: 8 bit Manchester Code

Speed 3\% to $100 \%$ in 1.4 s

- DALI signal: 16 bit Manchester Code

Speed 3\% to 100\% in 0.2 s
Programmable parameter:
Minimum dimming level
Maximum dimming level
Default minimum = 3\%
Programmable range $3 \% \leq$ MIN $\leq 100 \%$
Default maximum $=100$ \%
Programmable range $100 \% \geq$ MAX $\geq 3 \%$

Dimming curve is adapted to the eye sensitiveness.
Dimming is realized by amplitude dimming.
The DALI colour control functionality (part 209/Device Type 8) of this product has not been verified.
4.8 Dimming characteristics

Dimming characteristics as seen by the human eye

## 5. Software / Programming / Interfaces

### 5.1 Software / programming

With appropriate software and interface different functions can be activated and various parameters can be configured in the LED driver. The Driver supports the following software and interfaces:

Software / hardware for configuration:

- companionSUITE (deviceGENERATOR, deviceCONFIGURATOR, deviceANALYSER)
- masterCONFIGURATOR

Interfaces for data transfer:

- Control input DALI

### 5.2 Control input DALI

The control input is non-polar for digital control signals (DALI).
The control signal is not SELV. The control cable has to be installed in accordance to the requirements of low voltage installations.

Digital control with:

- DALI signal: 16 bit
- DSI signal: 8 bit

### 5.3 I-SELECT 2

By inserting a suitable resistor into the I-SELECT 2 interface, the current value can be adjusted. The relationship between output current and resistor value can be found in the chapter "Accessories I-SELECT 2 Plugs".
If the resistor is connected by wires a consistent base insulation must be ensured. Furthermore, a max. wire length of 2 m may not be exceeded and potential interferences have to be avoided.

Resistors for the main output current values can be ordered from Tridonic (see accessories).

Linear dimming

## 6．Functions

$\odot$
companionSUITE：
DALI－USB
The companionSUITE with deviceGENERATOR，deviceCONFIGURATOR and deviceANALYSER is available via our WEB page： https：／／www．tridonic．com／com／en／products／companionsuite．asp
• masterCONFIGURATOR：
DALI－USB
The masterCONFIGURATOR is available via our WEB page：
https：／／www．tridonic．com／com／en／software－masterconfigurator．asp

### 6.1 OEM Identification

## i <br> 110

The OEM (Original Equipment Manufacturer) can set his own identification number
DALI Part 251: Memory bank 1 extension.

### 6.2 OEM GTIN

## i <br> 1110

The Original Equipment Manufacturer (OEM) can set his own Global Trade Item Number (GTIN).
DALI Part 251: Memory bank 1 extension.

### 6.3 LED current

The LED output current must be adapted to the connected LED module. The value is limited by the current range of the respective device.

The output current of the LED driver can be adjusted in a certain range. For adjustment there are 4 options available.

Option 1: DALI
Adjustment is done by companionSUITE or by masterCONFIGURATOR.
Option 2: I-SELECT 2
By inserting a suitable resistor into the I-SELECT 2 interface, the current value can be adjusted.

The priority for current adjustment methods is DALI (highest priority) and I-SELECT 2 (lowest priority).

### 6.4 Device operating mode

## 000

A Tridonic Driver supports several control signals.
These control signals are automatically detected and the mode is adapted. If only one special device mode is required, this mode can be selected. "Automatic detection" is the default setting.

## 6.5 switchDIM

## $\theta$

Integrated switchDIM function allows a direct connection of a pushbutton for dimming and switching.
Brief push ( $<0.6 \mathrm{~s}$ ) switches LED driver ON and OFF. The dimm level is saved at power-down and restored at power-up. When the pushbutton is held, LED modules are dimmed. After repush the LED modules are dimmed in the opposite direction.
In installations with LED drivers with different dimming levels or opposite dimming directions (e.g. after a system extension), all LED drivers can be synchronized to $50 \%$ dimming level by a 10 s push.
Use of pushbutton with indicator lamp is not permitted.

## 6.6 corridorFUNCTION

With the corridorFUNCTION and a commercially available motion detector, it is easy to adapt the lighting in one area to its use.
That is, when the area is entered by a person, the lighting dims instantly to the desired brightness and is available in full strength.
After the area is left by the person, the brightness dims slowly to a smaller value or switches off completely.
The individual parameters of the desired profile, such as brightness values or delay times, can be adjusted flexibly and individually.

### 6.7 Constant Light Output (CLO)

With this function the light output of the LED module can be kept equal over the lifetime.
The light output of an LED module reduces over the course of its lifetime. The Constant Light Output (CLO) function compensates for this natural decline by constantly increasing the output current of the LED driver throughout its lifetime.
CLO shall be achieved by limitation of the LED current at the commissioning of the LED driver and providing a linear interpolation of the current over the time, depending on the data points given by the user.

### 6.8 DC operation

In emergency light systems with a central battery supply the DC recognition function uses the input voltage to detect if emergency mode is present.
The LED driver then automatically switches to DC mode and dims the light to the defined DC level.
Without DC recognition different and more complex solutions would have to be applied in order to detect emergency mode.
DC recognition is integrated in the device as standard.
No additional commissioning is necessary for activation

This is a safety-relevant parameter.
The setting is relevant for the dimensioning of the central battery system.

The LED driver is designed to operate on DC voltage and pulsed DC voltage. For a reliable operation, make sure that also in DC emergency operation the LED driver is run within the specified conditions as stated in chapter " 4.1 operating window".

Light output level in DC operation: programmable 1 - 100 \%
(factory default $=15 \%, \mathrm{EOF}_{\mathrm{i}}=0.13$ ).

The voltage-dependent input current of Driver incl. LED module is depending on the used load.

The voltage-dependent no-load current of Driver (without or defect LED module) is for:
AC: 21.8 mA (at $230 \mathrm{~V}, 50 \mathrm{~Hz}$ )
DC: 5-7mA (at $275-186 \mathrm{~V}, 0 \mathrm{~Hz}$ )

In DC operation dimming mode can be activated.
If Dimming on $D C$ is activated the requirements of the $D C$ recognition function are ignored.
Even if DC is detected, the LED driver continues to behave as in AC mode

- The present dimming level is retained
- An emergency light level defined for the DC recognition function (DC level) is ignored
- Control signals via DALI continue to be executed

If Dimming on DC is activated then emergency mode is not recognised.
The device no longer automatically switches to the emergency light level.

### 6.9 Enhanced power on level (ePOL)

$\square$

The Enhanced Power On Level parameter defines the power level that is set automatically when power is restored after a power failure.
The Enhanced Power On Level can be set to a fixed value ( $0-100 \%$ ) or can recall the memory value.
The memory value is the last value the LED driver was set to before the power failure.
This value applies not only in DALI device operating mode, but also in the device operating mode switchDIM.

### 6.10 DALI default parameters

## DALI-2

In order for all luminaires to react the same for each operation (switching, dimming, scene recall ...), these values must be set the same
These DALI standard parameters are supported by every DALI-2 device.

### 6.11 Scenes and groups

Each device can be a member of up to 16 groups.
Also, 16 different scene values can be stored in each device.

### 6.12 fade2zero

When the Driver is switched off, fade2zero allows a smooth dimming down to almost zero.
Activate the fade2zero function when programming with companionSUITE and set a DALI fade time. fade2zero only works if the minimum dimming level of the Driver is the default value.
The device then dims to far below the limit of its working window (dimming range).
This function is deactivated by default.

### 6.13 Power-up fading

The power-up function offers the opportunity to modify the on behavior. The time for fading on can be adjusted in a range of 0.2 to 16 seconds According to this value, the device dims from $0 \%$ up to the power-on level. By factory default no fading time is set ( $=0$ seconds).

### 6.14 Dimming curve

DALI:
The desired dimming behaviour is selected via two different dimming curves (logarithmic or linear).
The default setting of the dimming behaviour is logarithmic.

### 6.15 Colour temperature range

CCT

Here you can define the usable colour temperature range.
The colour temperature is limited by the physical upper and lower limits of the connected LED module.

### 6.16 colourSWITCH

colourSWITCH is an extension of switchDIM.
You can call up to 9 predefined colour temperature values.
With a short press via a pushbutton on terminal CS, the 9 predefined colour temperatures can be called up in succession.
With a long press via a pushbutton on terminal CS, the colour temperature is continuously adjusted.

In installations with LED drivers with different colour temperature or opposite colour temperature directions (e.g. after a system extension), all LED drivers can be synchronized to $4,500 \mathrm{~K}$ by a 10 s push.

A conventional pushbutton can be used to control the system via colourSWITCH.
Use of pushbutton with indicator lamp is not permitted.
If the device is controlled via DALI/DSI, colourSWITCH is not available.

## 7. Protective features

### 7.1 Intelligent temperature guard (ITG)

igent temperature guard (ITG) function provides effective protection against thermal overloads by slowly reducing the output if a defined internal temperature is exceeded.
The reduction of overtemperatures takes place in small steps every two minutes. As soon as the temperature drops again, the output power is gradually increased every 10 minutes.
On DC operation this function is deactivated to fulfill emergency requirements.

### 7.2 Intelligent Voltage Guard (IVG)

The Intelligent Voltage Guard (IVG) function warns of possible damage due to overvoltage or undervoltage.
The mains voltage is constantly monitored and if necessary appropriate responses are made:

- If the mains voltage is too low ( $<70 \mathrm{~V}$ ), the LED driver is switched off
- At a mains voltage between 70 and 140 V , the LED driver switches off and on again on a non-cyclic basis.
- In case of an overvoltage (> 318 V ), the LED driver sends feedback via DALI.

### 7.3 Short-circuit behaviour

In case of a short-circuit at the LED output the LED output is switched off. After restart of the LED driver the output will be activated again. The restart can either be done via mains reset or via interface (DALI, DSI, switchDIM).

### 7.4 No-load operation

The LED driver will not be damaged in no-load operation. The output will be deactivated and is therefore free of voltage. If a LED load is connected the device has to be restarted before the output will be activated again.

### 7.5 Overload protection

If the maximum load is exceeded by a defined internal limit, the LED driver turns off the LED output. After restart of the LED driver the output will be activated again.
The restart can either be done via mains reset or via interface (DALI, DSI, switchDIM).
7.6 Insulation between terminals

| Insulation | Mains | PE | LED | DALI |
| :--- | :---: | :---: | :---: | :---: |
| Mains | - | basic | double | basic |
| PE | basic | - | basic | basic |
| LED | double | basic | - | double |
| DALI | basic | basic | double | - |

double ... represents double or reinforced insulation.

## 7. Miscellaneous

### 7.1 Insulation and electric strength testing of luminaires

Electronic devices can be damaged by high voltage. This has to be considered during the routine testing of the luminaires in production.

According to IEC 60598-1 Annex Q (informative only!) or ENEC 303-Annex A, each luminaire should be submitted to an insulation test with 500 V dc for
1 second. This test voltage should be connected between the interconnected phase and neutral terminals and the earth terminal.
The insulation resistance must be at least $2 \mathrm{M} \Omega$.

As an alternative, IEC 60598-1 Annex Q describes a test of the electrical strength with 1500 V AC (or $1.414 \times 1500 \mathrm{~V}$ DC). To avoid damage to the electronic devices this test must not be conducted.

### 7.2 Conditions of use and storage

Humidity: $5 \%$ up to max. $85 \%$, not condensed (max. 56 days/year at $85 \%$ )

Storage temperature: $\quad-40^{\circ} \mathrm{C}$ up to max. $+80^{\circ} \mathrm{C}$
The devices have to be acclimatised to the specified temperature range (ta) before they can be operated.

The LED driver is declared as inbuilt LED controlgear, meaning it is intended to be used within a luminaire enclosure.
If the product is used outside a luminaire, the installation must provide suitable protection for people and environment (e.g. in illuminated ceilings).

### 7.3 Maximum number of switching cycles

All LED driver are tested with 50,000 switching cycles.
The actually achieved number of switching cycles is significantly higher.

### 7.4 Additional information

Additional technical information at www.tridonic.com $\rightarrow$ Technical Data

Lifetime declarations are informative and represent no warranty claim. No warranty if device was opened.
