<sup>(1)</sup> Inductance is measured at 100 kHz, 0.1Vac without DC current.

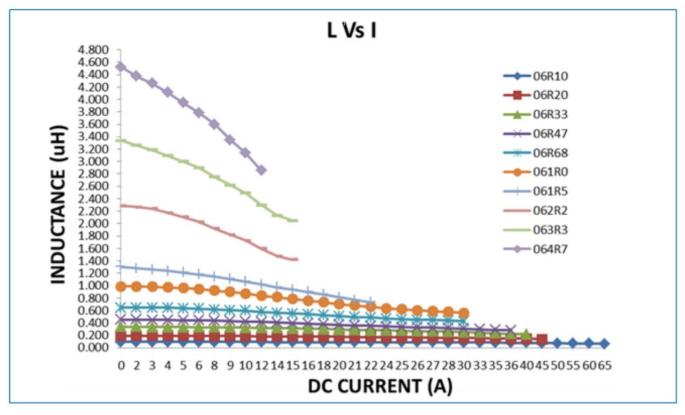

<sup>(2)</sup> The Heating Current is the approximate DC current which causes the component temperature to increase by 50°C. This current is determined by soldering the component on a typical application PCB, and then applying the current to the device for 30 minutes.

<sup>(3)</sup> The saturation current (Isat) is the approximate current at which the inductance will be decreased by 20% typical from its initial (zero DC) value. (4) The part temperature (ambient + temperature rise) should not exceed 155°C.
