5. 術語 Glossary

5-1. 標稱阻值：電阻器的設計電阻值，通常標注在電阻器上。

Rated resistance : Designed resistance value usually indicated on the resistor .

5-2. 額定環境溫度：電阻器在額定功率下可持續工作的最高環境溫度。請注意如果電阻器安裝在設備內部，那麼此處所謂的環境溫度並非設備周圍的溫度，而是設備內部、電阻器周圍的溫度。

Rated Ambient Temperature : Maximum ambient temperature at which the power rating may be applied continuously. The rated ambient temperature refers to the temperature around the resistor mounted inside the equipment, not to the air temperature outside the equipment .

5-3. 額定功率：在 70°C 環境溫度下進行耐久性試驗，而且阻值變化不超過該試驗的允許值時所允許的最大功率。

Rated power : At 70 °C ambient temperature durability test, and the change in resistance does not exceed the value of the test allows the maximum power allowed .

5-4. 降功率曲線：額定功率系適應在周圍溫度 70°C 可以連續負載的最大功率，但額定環境溫度如超過 70°C 時之額定電力則依圖的降功率曲線實施。

Rated power is maximum power which can be continuously loaded at specified ambient temperature 70 °C, however when Rated Ambient Temperature exceeds 70°C, rated power should be determined form the derating curve .

5-5. 額定電壓：額定環境溫度或端子部溫度下可連續施加的最大直流電壓或交流電壓（商用頻率實效值），用額定功率和公稱電阻值，按以下公式計算。但額定電壓不可超過最大工作電壓。

Rated Voltage : Maximum allowable D.C. or A.C. voltage(rms), capable to be continuously applied to a resistor or a resistor element under the rated ambient temperature or terminal part temperature. It shall be calculated from the rated power and nominal resistance using the following formula. The rated voltage shall not exceed the max. working voltage .

$$U : \text{電壓} \quad I : \text{電流} \quad U = \sqrt{P \times R} \quad I = \frac{U}{R}$$

$$P : \text{功率} \quad R : \text{阻值}$$

10. 使用注意事項 Precautions for Use

- 10.1 精密金屬膜電阻的導電層主要成分為鎳鉻合金，阻值越高膜層越薄，當阻值高於幾百 K 歐姆時，膜層厚度可能已經達到幾個納米，此時產品的可靠性會相對降低，尤其是高濕度的環境下，容易出現偶發性的失效異常。因此，高可靠性要求的產品設計，請勿為了方便而採用超高阻值。

Precision metal film resistor conductive layer mainly composed of Ni Cr alloy, the higher resistance layer is thinner, when high resistance in a few hundred K ohm, film thickness may have reached nanometer level. At this time the reliability of the product will be relatively lower, especially under high humidity environment, prone to occasional abnormal failure. Therefore, the product design of high reliability requirements, do not for convenience using ultra high resistance.

- 10.2 超高阻值部分建議使用我司的 MG 厚膜玻璃釉電阻（高功率要求適用）或 CHIP 晶片電阻（低功率要求適用），MG 電阻高阻段的耐溫、耐濕、耐壓、耐脈沖、耐腐蝕等方面的可靠性是眾電阻產品之首。

Ultra high resistance part recommend the use of our MG High Voltage Surge Resistor or Chip Resistor to replace the precision metal film resistors, Mg resistor of high temperature, humidity, pressure resistance, pulse, corrosion resistance and other aspects of the reliability is the public resistance.

- 10.3 低阻及超低阻的精密金屬膜電阻如溫度係數無法滿足或線路要求耐電流能力要求高時，請參考我司的 KN 繞線電阻，其在溫度係數、耐脈沖性能方面有很大的優越性。

Low resistance and low resistance precision metal film resistors such as temperature coefficient can not meet the line or requiring high current capability high requirements, please refer to our KN Wire Wound Resistors and the temperature coefficient, resistance pulse performance aspects have great advantages.

- 10.4 精密金屬膜電阻在同尺寸、同阻值的薄膜電阻類產品中膜層是最薄的，耐脈沖能力相對其它產品較差，請避免在高脈沖、連續脈沖的線路中使用高阻值產品。

Precision metal film resistors in the same size, with the resistance of the thin film resistor products film is the thinnest, pulse resisting ability relative to other inferior products, please avoid the use of high resistance products in high pulse and CW pulse circuit.

- 10.5 精密金屬膜電阻的導電成份決定了其高溫時金屬成份易被氧化，大功率產品使用時請注意其表面溫升及周圍散熱條件。請勿在電阻表面使用膠類產品固定或灌封。膠類一方面降低了產品的散熱性能，另一方面整機廠常用的 AB 膠類如酸碱性未控制好或未完全乾燥的情況下通電使用，會造成電阻導電膜與酸碱性分子產生電化學反應而出現偶發性的失效，俗稱電阻皮膜被“電蝕”。多年的經驗告訴我們，使用環氧膠類比有機硅膠類出現異常的幾率會更大。

Precision metal film resistance of the conductive composition determines its high temperature when the metal component is easy to be oxidized, high power products, please pay attention to the surface temperature rise and the surrounding cooling conditions. Do not use plastic products fixed or potting in resistance surface. Glue on the one hand reduces the radiation performance of the product, on the other hand, the whole plant commonly used AB class such as pH do not control or not completely dry the use of electricity, caused by conductive film and acid and alkali resistance molecular produce electrochemical reaction and occasional failure, commonly known as the electric resistance of coating was electrical erosion. Years of experience tells us that the use of epoxy silicone glue analogy abnormality rate will be greater.

- 10.6 精密金屬膜電阻推出了無腳型產品，可以用 SMT 自動貼片安裝，滿足波峰焊和迴流焊工藝。此款電阻為非切腳型生產，不存在切腳時端帽出現鬆動的隱患，經過酸洗、電鍍錫等工藝，100%短時間負載測試，可靠性優異。具體請參考我司 MEMF-MELF 產品。

Precision metal film resistors introduced a MILF type products, can be used SMT automatic patch installation, to meet the wave soldering and reflow process. The resistance of the non cutting foot type production, does not exist when the cut foot cap appears loose hidden danger, after pickling, electroplating tin and other processes, 100% short time load test, excellent reliability. Specific please refer to our MEMF-MELF products.
