

LINEAR INTEGRATED CIRCUIT

EARTH LEAKAGE CURRENT DETECTOR

DESCRIPTION

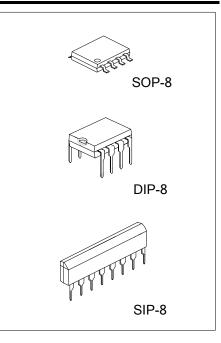

The UTC **M54123L** is a semiconductor integrated circuit with amplifier for a high-speed earth leakage circuit breaker.

For the amplifying parts of earth leakage circuit breaker, the UTC **M54123L** consists of differential amplifier, latch circuit and voltage regulator.

In normal operating, the UTC **M54123L** should be connected to the secondary side of the ZCT (zero current transformers). Here the ZCT detects leakage current different amplifiers' both input.

Then the signals which have been amplified are integrated by an external capacitor. The integrated signal connects to the input terminal of latch circuit whose output is suitable for the characteristics of high- speed earth leakage circuit breaker.

Until the input voltage reaches the fixed level, latch circuit doesn't become high. Then drives a thyristor which is connected to latch circuit's output terminal. Once the trigger latch circuit, only the power on again to reset.

FEATURES

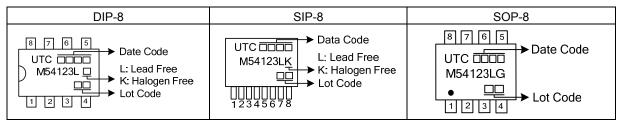

- * With good input sensitivity current temperature characteristics
- * High input sensitivity :V_T=6.1mV (Typ.)
- * Only need low external component count
- * High noise and surge-proof
- * Low power dissipation :P_D=5mW (Typ.)
- * May be used both as 100V and 200V.
- * Wide temperature range : from -20 °C to +80°C

■ ABSOLUTE MAXIMUM RATING (unless otherwise specified)

Notes: 1. Absolute maximum ratings are those values beyond which the device could be permanently damaged. Absolute maximum ratings are stress ratings only and functional device operation is not implied.

2. Current value between V_R and IN, and between IN and V_R is less than 1ms in the pulse width, and duty cycle is less than 12%, In applying AC current continuously, it is 100 mA in the off-state.

■ ELECTRICAL CHARACTERISTICS (Cont.)

- Notes: 1. Typical values are at T_A=25°C
 - 2. When standard value of voltage (60Hz) between V_R and V_I is minimum, and output O_S is low-level, or when standard value of voltage (60Hz) between V_R and V_I is maximum, and output O_S is high-level, it is considered as a good one.
 - 3. When standard value of voltage $V_{SC(ON)}$ is minimum, and output O_S is low-level, or when standard value of voltage $V_{SC(ON)}$ is maximum, and output O_S is high-level, it is considered as a good one.
 - 4. Supply current 2 is necessary to keep high in output O_S .
 - 5. After applying 30mV between V_R and V_I and shorting between them, it is considered as a good one if standard value of IGT flows out of output O_{S_L}
 - 6. After supply voltage applies 12V and output O_S is high-level, it is considered as a good one in the standard value of supply voltage and in the low-level of output O_S .
 - 7. Operating time is a time from applying fixed input till operating latch circuit in 0.047 μF between O_D and GND.

TYPICAL APPLICATION CIRCUIT

High-Speed Leakage Circuit Breaker With UTC M54123L

Note: Gate current must be selected.

Please select voltage resistance by AC supply voltage

Note: The value of R1, R2, C4, and C5 should be chosen in order to keep at least 12V in Vs.

Please connect C4 (>1 μ F) and C2 (<1 μ F).

ZCT and load resistance R_L of ZCT are connected between input pin 1 and 2.

Protective resistance (R_P =100 Ω) must be insurted.

 R_{L} and amplifier's output (in Pin 4) regulates sensitivity current

External capacitor C1 between pin 4 and GND is used for noise removal.

Please connect a varistor or a diode (2 pcs.) to ZCT in parallel, because of when large current is grounded in the primary side (AC line) of ZCT, the following situation can be abandoned: The wave form in the secondary side of ZCT is distorted and some signals do not appear in the output of amplifier.

Please connect capacitor (about $0.047\mu F$) between pin 6 and pin 7.

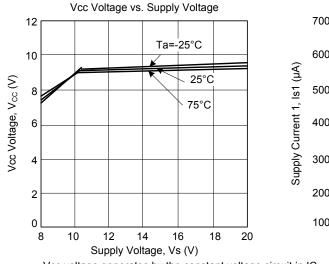

Capacitor C6 between pin 1 and GND is about 0.047μ F for removing noise.

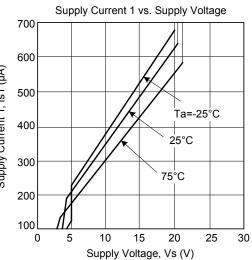

Operating Time vs. Input Voltage

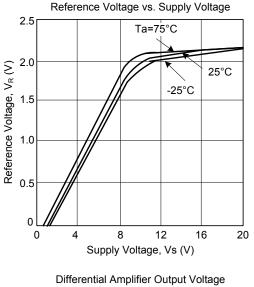

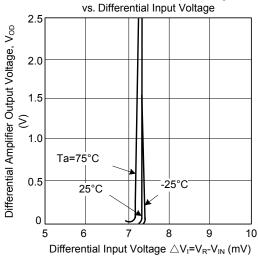

TYPICAL CHARACTERISTICS

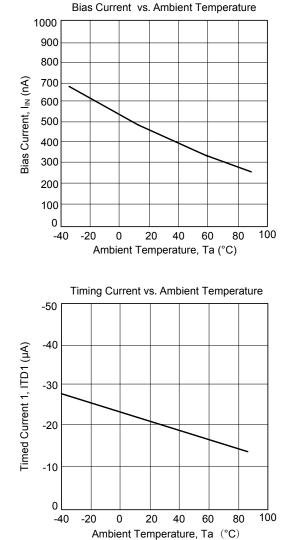

Vcc voltage generates by the constant voltage circuit in IC. This is measured not by M54123L but by a special element.
