UC3842A/3843A

LINEAR INTEGRATED CIRCUIT

CURRENT MODE PWM CONTROL CIRCUITS

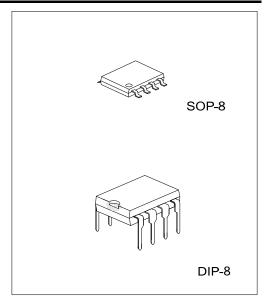

DESCRIPTION

The UTC UC3842A/3843A provide the necessary functions to implement off-line or DC to DC fixed frequency current mode, controlled switching circuits with minimal external components.

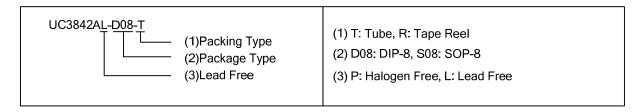

FEATURES

- *Low Start Up Current (Typical 0.12mA)
- *Automatic Feed Forward Compensation
- *Pulse-by-Pulse Current Limiting
- *Under-voltage Lockout with Hysteresis
- *Double Pulse Suppression
- *High Current Totem Pole Output to Drive MOSFET Directly
- *Internally Trimmed Band Gap Reference
- *500kHz Operation

Note:1. These parameters, although guaranteed, are not 100% tested in production.

- 2. Parameters measured at trip point of latch with $V_{PIN 2}=0$.
- 3. Gain defined as:

$$A = \frac{\mathbb{I} \ V_{PIN1}}{\mathbb{I} \ V_{PIN3}} \ ; 0 \mathbb{I} \ V_{PIN3} \mathbb{I} \ 0.8 V$$

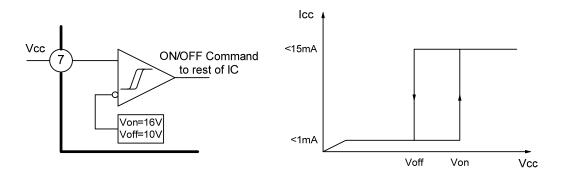

4. Adjust V_{CC} above the start threshold before setting at 15V.

■ OPEN-LOOP LABORATORY TEST FIXTURE

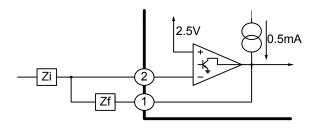

High peak current associated with capacity loads necessitate careful grounding techniques. Timing and bypass capacitors should be connected close to Pin 5 in single point GND. The transistor and $5k\Omega$ potentio-meter are used to sample the oscillator waveform and apply an adjustable Ramp to Pin 3.

UNDER-VOLTAGE LOCKOUT

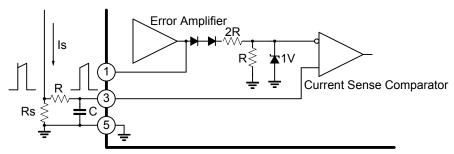

During Under-Voltage Lockout, the output driver is biased to a high impedance state. Pin 6 should be shunt to GND with a bleeder resistor to prevent activating the power switch with output leakage currents.

■ ERROR AMPLIFIER CONFIGURATION

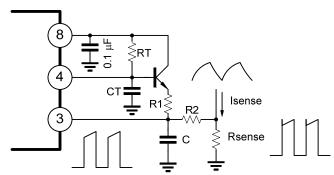

Error amplifier can source or sink up to 0.5mA

■ CURRENT SENSE CIRCUIT

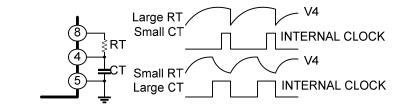

Peak current (Is) determined by the formula: I_{SMAX} =1.0V/Rs. A small RC filter be required to suppress switch transients.

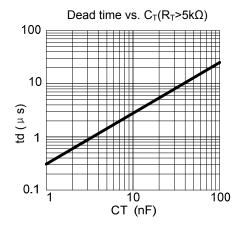

SLOPE COMPENSATION

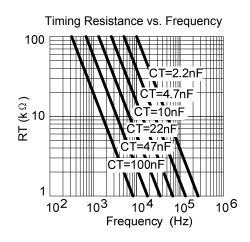

A fraction of the oscillator ramp can be resistively summed with the current sense signal to provide slope compensation for converts requiring duty cycles over 50%. Note that capacitor C, forms a filter with R2 to suppress the leading edge switch spikes.

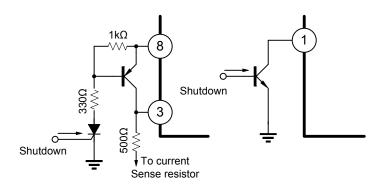

■ OSCILLATOR SECTION

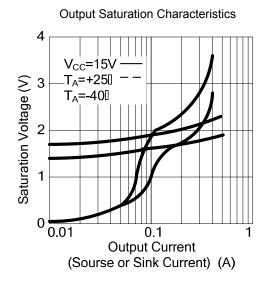

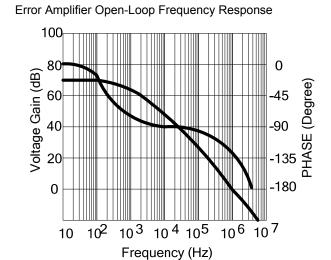

■ SHUTDOWN TECHNIQUES

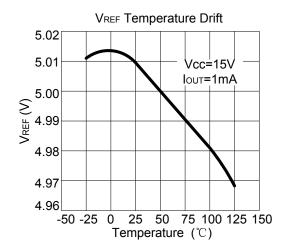

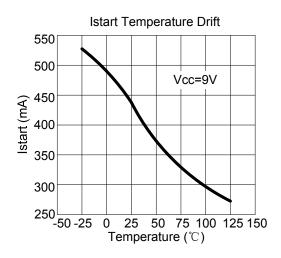

Shutdown UTC **UC3842A** can be accomplished by two methods; either raise Pin 3 above 1V or pull Pin 1 below a voltage two diode drops above ground. Either method caused the output of PWM comparator to be high(refer to block diagram). The PWM latch is reset dominant so that the output will remain low until the next clock cycle after the shutdown condition at Pins 1 and/or 3 is removed. In one example, an externally latched shut-down may be accomplished by adding an SCR which be reset by cycling V_{CC} below the lower UVLO threshold. At this point the reference turns off allowing the SCR to reset.
