Limit curve of measurable current $\hat{I}_P=f(R_M)$ Values for supply voltage ±22.80 V (±24 V -5 %)

Fig. 1: $I_{P,max} = f(R_m)$ @ ϑ_A

Absolute maximum conditions:

ϑ_A	$\leq 70^\circ\text{C}$	$70^\circ\text{C} < \vartheta_A \leq 85^\circ\text{C}$
$I_P = I_{P,max}$ up to	1800 A DC	1200 A DC

Stresses above these conditions may cause permanent damage. Exposure to absolute maximum rating conditions for extended periods will degrade device reliability and lifetime expectancy. Functional operation of the device at these or any other conditions beyond those specified in this specification is not permitted.

Schematic diagram:

The polarity of the supply voltage is very important!

With the wrong polarity, the current sensor will be damaged after a few seconds!

Offset ripple reduction

The offset ripple can be reduced by an external low pass. The simplest solution is a passive low pass filter of 1st order by connecting a capacitor parallel to the burden resistor R_M as shown on page 3. The required capacitance can be calculated as follows:

$$C_a = \frac{1}{2\pi \cdot R_M \cdot f_g}$$

In this case the response time is enlarged. It is calculated from:

$$t'_r \geq t_r + 2,5R_M C_a$$

Explanation to parameters used in this datasheet

Accuracy

$X_{\text{total}}(I_{\text{PN}})$: The sum of all possible errors over the temperature range by measuring a current I_{PN} :

$$X_{\text{total}} = 100 \cdot \left| \frac{I_S(I_{\text{PN}})}{K_N \cdot I_{\text{PN}}} - 1 \right|$$

X : Permissible measurement error in the final inspection at RT.
 I_{SB} is the DC output current for a DC primary current with the same value as the (positive) rated current I_{PN} (with $I_0 = 0$)

$$X = 100 \cdot \left| \frac{I_{\text{SB}}}{I_{\text{SN}}} - 1 \right|$$

X_{Ti} : Temperature drift of the rated value orientated output term.
 I_{SN} (cf. Notes on F) in a specified temperature range:
 I_{SB} is the secondary current at temperature ϑ_{A1} or ϑ_{A2}

$$X_{\text{Ti}} = 100 \cdot \left| \frac{I_{\text{SB}}(\vartheta_{A2}) - I_{\text{SB}}(\vartheta_{A1})}{I_{\text{SN}}} \right|$$

ε_L : Linearity fault where I_P is any input DC and I_{Sx} the corresponding output term. ($I_0 = 0$).

$$\varepsilon_L = 100 \cdot \left| \frac{I_P}{I_{\text{PN}}} - \frac{I_{\text{Sx}}}{I_{\text{SN}}} \right|$$

Offset and drift

I_{OH} : Zero variation after overloading with a DC of tenfold the rated value ($R_M = R_{MN}$)

I_{ot} : Long term drift of I_0 after 100 temperature cycles in the range -40 to 85 °C.

Dynamic properties

t_{ra} : Reaction time, measured as a delay time between a rectangular primary current ($di/dt \approx 1200A/\mu s$) and the output current I_S at $I_P = 0.1 * I_{\text{PN}}$

t_r : Response time, measured as a delay time between a rectangular primary current and the output current I_S at $I_P = 0.9 * I_{\text{PN}}$

Voltage ratings (according to IEC 61800-5-1:2007)

U_{PD} : Rated discharge voltage (recurring peak voltage separated by the insulation)

U_{sys} : System voltage: RMS value of rated voltage

U_{AC} : Working voltage: RMS voltage which occurs by design in a circuit or across an insulation
