## Surface Mounted Power Resistor Thick Film Technology

DESIGN SUPPORT TOOLS AVAILABLE

## FEATURES

- AEC-Q200 qualified
- Surface mounted resistor - TO-252 (DPAK) style package
- Wide resistance range: $0.016 \Omega$ to $700 \mathrm{k} \Omega$
- Non inductive
- Resistor isolated from metal tab
- Solder reflow secure at $270^{\circ} \mathrm{C} / 10 \mathrm{~s}, \mathrm{MSL}=1$
- Material categorization: for definitions of compliance please see www.vishay.com/doc?99912

## DIMENSIONS in millimeters

Footprint recommendation for solderable contact area:

## Notes

- For the assembly, we recommend the lead (Pb)-free thermal profile as per J-STD-020C
- Power dissipation is 3.2 W at an ambient temperature of $25^{\circ} \mathrm{C}$ when mounted on a double sided copper board using FR4 HTG, $70 \mu \mathrm{~m}$ of copper, $39 \mathrm{~mm} \times 30 \mathrm{~mm} \times 1.6 \mathrm{~mm}$, with thermal vias
- For other information about dissipation, see the Application Note 52027: "Thermal Management on SMD Thick Film Resistors (D2TO20, D2TO35, DTO25)"

## POWER RATING

The temperature of the case should be maintained within the limits specified.

## CHOICE OF THE BOARD

The user must choose the board according to the working conditions of the component (power, room temperature). Maximum working temperature must not exceed $150^{\circ} \mathrm{C}$. The dissipated power is simply calculated by the following ratio:

$$
\begin{equation*}
P=\frac{\Delta T}{R_{T H(j-c)}+R_{T H}(c-h)+R_{T H}(h-a)} \tag{1}
\end{equation*}
$$

P: $\quad$ Expressed in W
$\Delta \mathrm{T}$ : Difference between maximum working temperature and room temperature
$R_{T H}(j-c)$ : Thermal resistance value measured between resistive layer and outer side of the resistor. It is the thermal resistance of the component: $5^{\circ} \mathrm{C} / \mathrm{W}$.
$\mathrm{R}_{\mathrm{TH}(\mathrm{c}-\mathrm{h})}$ : Thermal resistance value measured between outer side of the resistor and upper side of the board. This is the thermal resistance of the solder layer.
$R_{T H(h-a)}$ : Thermal resistance of the board.

## Example:

$\mathrm{R}_{\text {TH }(\mathrm{c}-\mathrm{h})}+\mathrm{R}_{\mathrm{TH}(\mathrm{h}-\mathrm{a})}$ for DTO25 power rating 3 W at ambient temperature $+25^{\circ} \mathrm{C}$.
Thermal resistance $\mathrm{R}_{\mathrm{TH}(\mathrm{j}}$ - c): $: 5^{\circ} \mathrm{C} / \mathrm{W}$
Considering equation ${ }^{(1)}$ we have:
$\Delta \mathrm{T}=150^{\circ} \mathrm{C}-25^{\circ} \mathrm{C}=125^{\circ} \mathrm{C}$
$R_{\text {TH }(j-c)}+R_{T H(c-h)}+R_{T H}(\mathrm{~h}-\mathrm{a})=\Delta \mathrm{T} / \mathrm{P}=125 / 3=41.7^{\circ} \mathrm{C} / \mathrm{W}$
$\mathrm{R}_{\text {TH }(\mathrm{c}-\mathrm{h})}+\mathrm{R}_{\text {TH }}(\mathrm{h}-\mathrm{a})=41.7^{\circ} \mathrm{C} / \mathrm{W}-5^{\circ} \mathrm{C} / \mathrm{W}=36.7^{\circ} \mathrm{C} / \mathrm{W}$

## ACCIDENTAL OVERLOAD

In any case the applied voltage must be lower than the maximum overload voltage of $U_{s}=750 \mathrm{~V}$. The values indicated on the graph below are applicable to resistors onto a board.

## ENERGY CURVE at $25^{\circ} \mathrm{C}$

POWER CURVE at $25^{\circ} \mathrm{C}$

Single Pulse:
These informations are for a single pulse on a cold resistor at $25^{\circ} \mathrm{C}$ (not already used for a dissipation) and for pulses
of $\quad 100 \mathrm{~ms}$ maximum duration.
The formula used to calculate $E$ is:

$$
E=P \times t=\frac{U^{2}}{R} \times t
$$

with:
$E(J)$ : Pulse energy
$P(\mathrm{~W})$ : Pulse power
$t(\mathrm{~s})$ : Pulse duration
$U(\mathrm{~V})$ : Pulse voltage
$R(\Omega)$ : Resistor
The energy calculated must be less than that allowed by the graph.

Repetitive or Superimposed Pulses:
The following formula is used to calculate the "equivalent" energy of a repetitive pulse or the "equivalent energy" of a pulse on a resistor that is already dissipating power.

$$
E_{\mathrm{c}}=E \times\left(1+\frac{P_{\mathrm{a}}}{P_{\mathrm{r}}}\right)
$$

with:
$E_{c}(\mathrm{~J})$ : Equivalent pulse energy
$E(J)$ : Known pulse energy
$P_{\mathrm{r}}$ : Resistor power rating
$P_{\mathrm{a}}$ : Mean power being dissipated
The energy calculated must be less than that allowed by the graph and the average power dissipated $\left(P_{\mathrm{a}}\right)$ must not exceed the continuous power of resistor.

IMPEDANCE CURVE $10 \Omega$ to $1 \mathrm{k} \Omega$ from 100 kHz to 300 MHz

## PACKAGING

- Tube: max. 50 units per tube
- Reel: max. 500 units per reel

## MARKING

Model, style, resistance value (in $\Omega$ ), tolerance (in \%), manufacturing date, Vishay Sfernice trademark.

| ORDERING INFORMATION |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| DTO | 025 | C | $100 \mathrm{k} \Omega$ | $\pm 1$ \% | XXX | e3 |
