## 28 V, 56 m $\Omega$, Load Switch with Programmable Current Limit and Slew Rate Control

## OPERATION DESCRIPTION

SiP32419 and SiP32429 are load switches that integrate multiple control features that simplify the design and increase the reliability of the circuitry connected to the switch. Both devices are $56 \mathrm{~m} \Omega$ switches designed to operate in the 6 V to 28 V range. An internally generated gate drive voltage ensures good $\mathrm{R}_{\mathrm{ON}}$ linearity over the input voltage operating range.
The SiP32419 and SiP32429 have a slew rate control circuit that controls the switch turn-on time to the value set by an external capacitor.
After soft start, an over-current protection circuit (OCP) continuously monitors the current through the load switch, and controls the switch impedance to limit the current to the level programmed by an external resistor. If the over-current condition persists for more than 7 ms , the switch shuts off automatically. The SiP32419 and SiP32429 has an over temperature protection circuit (OTP) which will shut the switch off if the junction temperature exceeds about $135^{\circ} \mathrm{C}$. The OTP circuit will release the switch when the temperature has decreased by about $40^{\circ} \mathrm{C}$ of hysteresis.
When an OCP or an OTP fault condition is detected the FLG pin is pulled low. For the SiP32429, the fault flag will release 150 ms after the fault condition is cleared, and the switch will automatically turn on at the programmed slew rate. For the SiP 32419 , the switch will remain off and the fault flag will remain on. The switch will be reset by toggling either control signal on EN pin or the input power if it is not under over temperature fault condition.
These devices feature a low voltage control logic interface which can be controlled without the need for level shifting. These devices also include a power good flag.
SiP32419 and SiP32429 are available in a space efficient DFN10 3 mm x 3 mm package.

## FEATURES

- 6 V to 28 V operation voltage
- $56 \mathrm{~m} \Omega$ typical on resistance
- Programmable soft start
- Programmable current limit
- Programmable soft start control

RoHS COMPLIANT halogen FREE Available

- Over temperature protection
- Power good, when $\mathrm{V}_{\text {OUt }}$ reaches $90 \%$ of $\mathrm{V}_{\mathrm{IN}}$
- Fault flag on for thermal shutdown and OCP
- Under voltage lockout: 4.8 V / 5.4 V (typ. / max.)
- Auto-retry SiP32429 and latch-off SiP32419 versions
- Package: DFN-10 $3 \mathrm{~mm} \times 3 \mathrm{~mm}$
- IEC 62368-1 certified
- Material categorization: for definitions of compliance please see www.vishay.com/doc?99912

## APPLICATIONS

- eFuse, smart load switch
- White goods, appliances
- Flat panel displays
- Set top boxes, game consoles
- Smart meters, medical analyzers
- Industrial 4.0 loT
- Telecom network
- RF LNA power
- SSD drive, data storage

## Notes

a. Device mounted with all lead and power pad soldered or welded to PCB
b. Derate $11.4 \mathrm{~mW} /{ }^{\circ} \mathrm{C}$ above $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## DETAILED DESCRIPTION

## Over Current Limit

The SiP32419 and SiP32429 current limit control circuit responses within $1 \mu$ s (typ.) when an over current event occurs. During this brief period before the over current protection circuit is engaged, the parts will see a surge current especially under a severe output short condition. The magnitude of the surge current developed during the period when the overcurrent protection is not engaged is determined by impedance in the loop from the input current source to ground and the response time. This impedance is the sum total of the current source impedance, the path resistance and inductance and the load impedance. It is recommended to design the circuit to keep the peak current under 50 A by ensuring that there is sufficient impedance in the path to limit current to this recommended maximum of 50 A . Once the current limit circuit is engaged, the SiP32419 / SiP32429 will limit the current to the programmed set point. If the over current event exceeds 7 ms , the switch is turned off and the FLG pin is pulled low.
The SiP32429 features auto retry logic design and as long as enable is high, the part will restart after a 150 ms time out. The SiP32419 will remain off and can be reset by toggling $V_{\text {IN }}$ or EN.
The current limit is set by connecting a resistor between the lim min and GND. $_{\text {SET }}$ can be calculated by the following formula:

$$
\mathrm{I}_{\mathrm{Lim}}=\frac{1.24 \mathrm{~V}}{\mathrm{R}_{\mathrm{SET}}} \times 5000
$$

Where:
$\mathrm{l}_{\text {LIM }}=$ is the target current limit setting.

| 8.25 | 0.56 | 0.75 | 0.94 | 25 |

Fig. 32 - Current Limit vs. R $_{\text {SET }}$

## Soft Start

The soft start time can be calculated by the following formula:

$$
\frac{\Delta V_{\text {OUT }}}{\Delta t}=\frac{I_{\text {SS }}}{C_{S S}} \times \frac{R_{\text {OUT }} \times 5000}{R_{\text {SET }}}
$$

Where:
$\Delta t$ is the soft start time
$\Delta \mathrm{V}_{\text {OUT }}$ is the output voltage range
$I_{S S}$ is the built-in current source charging the soft start capacitor $\mathrm{C}_{S S}$. I $\mathrm{I}_{S S}$ value is $5 \mu \mathrm{~A}$ typical.
$\mathrm{C}_{S S}$ is the soft start time setting capacitor.
$R_{S E T}$ is the current limit setting resistor.
$\mathrm{R}_{\text {OUT }}$ is the output load.

## Enable

The enable pin needs to be high for the device to become active. This can be accomplished by applying a logic high signal to the EN pin. Alternatively this pin can be hardwired through a resistor divider to the $\mathrm{V}_{\mathbb{N}}$, thus keeping the switch permanently on as long as the supply is present.

## $\overline{F L G}$

The FLG is an open drain output and will be pulled low in fault condition. This pin can be pulled up through a 100 K resistor.

## PG

The $\overline{P G}$ is an open drain output that will be pulled low when output voltage passes $90 \%$ of the $\mathrm{V}_{\mathrm{IN}}$. This pin can be pulled up through a 100 K resistor.

## APPLICATION INFORMATION

## Input Capacitor

While bypass capacitors at the inputs pins are not required, a $2.2 \mu \mathrm{~F}$ or larger capacitors for $\mathrm{C}_{\mathbb{I N}}$ is recommended in almost all applications. The bypass capacitors should be placed as physically close to the device's input pins to be effective to minimize transients on the input. Ceramic capacitors are recommended over tantalum because of their ability to withstand input current surges from low impedance sources such as batteries.

## Output Capacitor

The device does not require an output capacitor for proper operation. A proper value $\mathrm{C}_{\text {OUt }}$ is recommended to accommodate load transient per circuit design requirements. There are no ESR or capacitor type requirements.

## Over Temperature Shutdown

In case an over temperature event happens, the SiP32419 and SiP32429 will turn the switch off immediately. The SiP32429 will then retry to start 150 ms after the temperature is back to normal; during this period, $\overline{\text { FLG }}$ will be pulled low. The SiP32429 FLG will be pulled high 150 ms after the OT event has finished. The SiP32419 will remain off and not retry to start, FLG will remain to be pulled low.

## Thermal Consideration

SiP32419 and SiP23429 are designed to maintain a constant output load current. Due to physical limitations of the layout and assembly of the device the maximum switch current should be kept at reasonably safe level. However, another limiting characteristic of the safe operating load current is the thermal power dissipation.
