### DESIGN SUPPORT TOOLS AVAILABLE

### DESCRIPTION

The VO1263AB and VO1263AAC photovoltaic MOSFET driver consists of two LEDs optically coupled to two photodiode arrays. The photodiode array provides a floating source with adequate voltage and current to drive high power MOSFET transistors. Optical coupling provides a high I/O isolation voltage. In order to turn the MOSFET off, an external resistance (gate-to-source) is required for gate discharge.

### FEATURES

**FUNCTIONAL DESCRIPTION**

Fig. 1 outlines the IV characteristics of the illuminated photodiode array (PDA). For operation at voltages below  $V_{OC}$ , the PDA acts as a nearly constant current source. The actual region of operation depends upon the load.

The amount of current applied to the LED (pins 1 and 2 or 3 and 4) determines the amount of light produced for the PDA. For high temperature operation, more LED current may be required.
