

# 4.3inch Capacitive Touch LCD User Manual

## OVERVIEW

This is a multicolor graphic LCD display, 4.3inch diagonal, 800x480 pixels.

It is able to display 16,777,216 colors via the 24-bit RGB interface, supports up to 5-points capacitive touch control via I2C interface.

## SPECIFICATIONS

Working voltage :	3.3V/5V
LCD Interface :	24-bit RGB
Logic Level :	3.3V
LCD Type :	TFT
Display Colors :	16,777,216
Resolution :	800(H)RGB x 480(V)
Display Size :	95.04 (H) x 53.856 (V)mm
Dot Pitch :	0.1188(H) x 0.1122(V) mm
Touch controller :	GT911
Touch Interface :	I2C
Dimension :	106 x 68(mm)

## INTERFACE

PIN	Description
5V	Power supply
IRQ	Interrupt (Touch)
SDA	I2C data pin (Touch)
NC	No connected
RST	Reset
SCL	I2C clock pin (Touch)
PWM	Backlight brightness adjustment
R0-R7	Data lines (Red)
G0-G7	Data lines (Green)
B0-B7	Data lines (Blue)
DISP	Brightness control enable (High active)
CLK	LCD clock
VSYNC	Horizontal synchronization
HSYNC	Vertical synchronization
DE	Control mode selection
GND	Ground

STM32F429: Examples based on Open429I-C, whose chip is STM32F429IGT6. The project uses HAL libraries

STM32F746: Examples based on Open746I-C, whose chip is STM32F746IGT6. The project uses HAL libraries. With Open746I-C, both RGB Header interface and RGB Cable interface are compatible, so we provide two examples for both interfaces.

Clean.bat: Batch files used to clean redundant files generated when compiling.

## STM32F7 EXAMPLES

Development board used is Waveshare Open746I-C, chip is STM32F746IGT6. The project uses HAL libraries.

## HARDWARE CONNECTION

For this board, we provide two examples, with same functions. The only difference of them is that the touch interface

#### EXPECTED RESULT

1. Display a picture
2. Display English and Chinese characters
3. Draw point, line, rectangle and circle.
4. Display the points where finger touch, supports up to 5-points touch

#### STM32F4 EXAMPLES

Development board used is Waveshare Open429I-C, chip is STM32F429IGT6. The project uses HAL libraries.

#### HARDWARE CONNECTION

The RGB Cable interface (Interface 2) is used for resistive touch screen, isn't compatible with capacitive screen, therefore, we only provide RGB Header example (Interface 1) for this board.

## FAQ

1. Why the codes used RGB565 instead of RGB888 for color displaying?
  - The data of RGB888 are too much, required much more RAM. SDRAM is 16-bit input/output. If we use RGB888, we should save RGB data by writing several times, and cost much more times and CPU. In fact, even we use RGB565 to transmit data, LCD controller will convert it to RGB888 format and needn't cost external CPU
