Note 1.5-1: This pin (CS\#) is the chip select input connecting to the MCU. The chip is enabled for MCU communication only when CS\# is pulled Low.

Note 1.5-2: This pin (D/C\#) is Data/Command control pin connecting to the MCU. When the pin is pulled HIGH, the data will be interpreted as data. When the pin is pulled Low, the data will be interpreted as command.

Note 1.5-3: This pin (RES\#) is reset signal input. The Reset is active Low.
Note 1.5-4: This pin (BUSY) is Busy state output pin. When Busy is low, the operation of chip should not be interrupted and any commands should not be issued to the module. The driver IC will put Busy pin low when the driver IC is working such as:

### 1.6 Reference Circuit

## Note :

1. Inductor L1 is wire-wound inductor. There are no special requirements for other parameters.
2. Suggests using Si1304BDL or Si1308EDL TUBE MOS (Q1), otherwise it may affect the normal boost of the circuit.
3. The default circuit is 4 -wire SPI. If the user wants to use 3 -wire SPI, the resistor R4 can be removed when users design.
4. Default voltage value of all capacitors is 50 V .

## 2. Environmental

### 2.1 Handling, Safety and Environmental Requirements

| WARNING |
| :--- |
| The display glass may break when it is dropped or bumped on a hard surface. |
| Handle with care. |
| Should the display break, do not touch the electrophoretic material. In case of |
| contact with electrophoretic material, wash with water and soap. |

## CAUTION

The display module should not be exposed to harmful gases, such as acid and alkali gases, which corrode electronic components.

Disassembling the display module can cause permanent damage and invalidate the warranty agreements.

Observe general precautions that are common to handling delicate electronic components. The glass can break and front surfaces can easily be damaged. Moreover the display is sensitive to static electricity and other rough environmental conditions.

## 3.3-2) MCU I nterface

## 3.3-2-1) MCU Interface Selection

In this module, there are 4 -wire SPI and 3 -wire SPI that can communicate with MCU. The MCU interface mode can be set by hardware selection on BS1 pins. When it is "Low", 4wire SPI is selected. When it is "High", 3-wire SPI (9 bits SPI) is selected.

| Pin Name | Data/ Command Interface |  | Control Signal |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Bus interface | D1 | D0 | CS\# | D/C\# | RES\# |
| SPI4 | SDIN | SCLK | CS\# | D/C\# | RES\# |
| SPI3 | SDIN | SCLK | CS\# | L | RES\# |

Table 7-1: MCU interface assignment under different bus interface mode
Note 3-2: L is connected to VSS
Note 3-3: H is connected to VCI

## 3.3-2-2) MCU Serial Interface (4-wire SPI)

The 4-wire SPI consists of serial clock SCLK, serial data SDIN, D/C\#, CS\#. In SPI mode, D0 acts as SCLK, D1 acts as SDIN.

| Function | CS\# | D/C\# | SCLK |
| :---: | :---: | :---: | :---: |
| Write Command | L | L | $\uparrow$ |
| Write data | L | H | $\uparrow$ |

Table 7-2: Control pins of 4-wire Serial Peripheral interface
Note 3-4: $\uparrow$ stands for rising edge of signal
SDIN is shifted into an 8-bit shift register in the order of D7, D6, ... D0. The data byte in the shift register is written to the Graphic Display Data RAM (RAM) or command register in the same clock. Under serial mode, only write operations are allowed.

Figure 7-1: Write procedure in 4-wire Serial Peripheral Interface mode

## 3.3-2-3) MCU Serial I nterface (3-wire SPI)

The 3-wire serial interface consists of serial clock SCLK, serial data ADIN and CS\#.
In 3-wire SPI mode, D0 acts as SCLK, D1 acts as SDIN, The pin D/C\# can be connected to an external ground.
The operation is similar to 4-wire serial interface while D/C\# pin is not used. There are altogether 9 -bits will be shifted into the shift register on every ninth clock in sequence: D/C\# bit, D7 to D0 bit. The D/C\# bit (first bit of the sequential data) will determine the following data byte in shift register is written to the Display Data RAM (D/C\# bit = 1) or the command register ( $\mathrm{D} / \mathrm{C} \#$ bit $=0$ ). Under serial mode, only write operations are allowed.

This command starts transmitting data and write them into SRAM. To complete data transmission, command DSP (Data transmission Stop) must be issued. Then the chip will start to send data/VCOM for panel.
In $B / W$ mode, this command writes "OLD" data to SRAM.
In $B / W / R e d$ mode, this command writes " $B / W$ " data to SRAM.
In Program mode, this command writes "OTP" data to SRAM for programming.

|  | 1 | 1 | The data of address ( n ) in the OTP |  |  |  |  |  |  |  |

The command is used for reading the content of OTP for checking the data of programming.
The value of $(\mathrm{n})$ is depending on the amount of programmed data, tha max address $=$ $0 \times F F F$.

This command is set for saving power during fresh period. If the output voltage of VCOM / Source is from negative to positive or from positive to negative, the power saving mechanism will be activated. The active period width is defined by the following two parameters. VCOM_W[3:0]: VCOM power saving width (unit = line period)

SD_W[3:0]: Source power saving width (unit = 660nS)

## 6. Optical characteristics

### 6.1 Specifications

Measurements are made with that the illumination is under an angle of 45 degrees, the detection is perpendicular unless otherwise specified.
$\mathrm{T}=25^{\circ} \mathrm{C}$

Note 6-1: Luminance meter: Eye - One Pro Spectrophotometer
Note 6-2: Panel life will not guaranteed when work in temperature below 0 degree or above 50 degree. Each update interval time should be minimum at 180 seconds.

### 6.2 Definition of contrast ratio

The contrast ratio (CR) is the ratio between the reflectance in a full white area (R1) and the reflectance in a dark area (Rd)() :
R1: white reflectance
Rd: dark reflectance
$C R=R 1 / R d$

### 6.3 Reflection Ratio

The reflection ratio is expressed as :
$\mathrm{R}=$ Reflectance Factor white board $\quad \mathrm{x}\left(\mathrm{L}_{\text {center }} / \mathrm{L}_{\text {white board }}\right)$
$L$ center is the luminance measured at center in a white area ( $R=G=B=1$ ). $L$ white board is the luminance of a standard white board. Both are measured with equivalent illumination source. The viewing angle shall be no more than 2 degrees.

### 6.4 Bi-stability

The Bi-stability standard as follows:

| Bi-stability | Result |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| 24 hours Luminance drift |  |  |  |  |
|  | White state | $\triangle L^{*}$ | - | 3 |
|  | Black state | $\triangle L^{*}$ | - | 3 |

## 7. Point and line standard

Remarks: Spot define: That only can be seen under WS or DS defects.
Any defect which is visible under gray pattern or transition process but invisible under black and white is disregarded.
Here is definition of the "Spot" and "Scratch or line defect".
Spot: $W>1 / 4 L \quad$ Scratch or line defect: $W \leqslant 1 / 4 L$
Definition for $L / W$ and $D$ (major axis)
FPC bonding area pad doesn't allowed visual inspection.

## 8. Packing

## 9. Precautions

(1) Do not apply pressure to the EPD panel in order to prevent damaging it.
(2) Do not connect or disconnect the interface connector while the EPD panel is in operation.
(3) Do not touch IC bonding area. It may scratch TFT lead or damage IC function.
(4) Please be mindful of moisture to avoid its penetration into the EPD panel, which may cause damage during operation.
(5) If the EPD Panel / Module is not refreshed every 24 hours, a phenomena known as "Ghosting" or "Image Sticking" may occur. It is recommended to refreshed the ESL / EPD Tag every 24 hours in use case. It is recommended that customer ships or stores the ESL / EPD Tag with a completely white image to avoid this issue
(6) High temperature, high humidity, sunlight or fluorescent light may degrade the EPD panel's performance. Please do not expose the unprotected EPD panel to high temperature, high humidity, sunlight, or fluorescent for long periods of time.
