

WS4612

60mΩ, Current Limited, Power Distribution Switch

Descriptions

The WS4612 is a high-side switch with ultra-low ON resistance P-MOSFET. Integrated current-limit function can limit inrush current for heavy capacitive load, over load current, and short-circuit current to protect power source.

The WS4612 is also integrated reverse protection function to eliminate any reverse current flow across the switch when the device is off. Output auto-discharge function makes output voltage off quickly while the device shutdown. Thermal shutdown function can protect the device and load.

The WS4612 is available in SOT-23-5L packages. Standard product is Pb-free and Halogen-free.

Features

- Input voltage range : 2.5-5.5V
- Main switch R_{ON} : 60mΩ@VIN=5.0V
- Current limit accurate : ±15%
- Adj. current limit range : 0.1A-2.5A(Typ.)
- Quiescent Supply Current : 26μA
- Under Voltage Lockout
- Auto discharge
- Reverse block (No “body diode”)
- Over temperature protection

Applications

- USB peripherals
- USB Dongle
- USB 3G data card
- 3.3V or 5V Power Switch
- 3.3V or 5V Power Distribution

Operation Information

Power Switch

The power switch is a P-channel MOSFET with low $R_{DS(ON)}$ for power management or USB power distribution applications. The WS4612 has reverse voltage protection to prevents current flow from OUT to IN and IN to OUT when device is off.

Current-Limit Protection(WS4612EA)

The WS4612 provide current limit protection function to protect power source when over-current condition occurs. The current limit I_{OC} can be adjusted by external resistor connected between ISET pin and GND. The I_{OC} typical value can be calculated using following equation:

$$I_{OC}(A) = \frac{6.8K}{R_{SET}}$$

Current-Limit Protection(WS4612E(B/C/D/E))

The WS4612 provide current limit protection function to protect power source when over-current condition occurs. The typical current limit threshold is set internally to approximately 1.4A(WS4612EB), 2.1A(WS4612EC), 2.4A(WS4612ED), 3A(WS4612EE).

Short-Circuit Protection

The WS4612 provide short circuit protection function. The output current will be limited to safe level. The short-circuit protection is used to reduce power dissipation of the device and protect power source during short-circuit condition.

Fault indicate(WS4612E(B/C/D/E))

The \overline{FLG} open drain output is asserted (active low) with 7.5ms(Typ.) delay when an over-current or over-temperature condition is encountered. The \overline{FLG} signal will remain asserted until the over-current or over-temperature condition is removed.

UVLO Protection

To avoid malfunction of the WS4612 at low input voltages, an under voltage lockout is included that disables the device, until the input voltage exceeds 2.25V (Typ.)

Shutdown Mode

Drive EN to place the WS4612 in shutdown mode. In shutdown mode, input current falls to smaller than 1uA.

Thermal Shutdown

As soon as the junction temperature (T_J) exceeds 160°C (Typ.), the WS4612 goes into thermal shutdown. In this mode, the device is turned off and will turn on again until Junction temperature falls below 140°C (Typ.).

Application Information

Input Capacitor

A 1 μ F input bypass ceramic capacitor(C_{IN}) from IN to GND, located near the WS4612 is strongly recommended to suppress the voltage overshooting during short circuit fault event. Without the bypass capacitor, the output short may cause sufficient ringing on the input (from supply lead inductance) to damage the device.

Output Capacitor

A low ESR, 150 μ F aluminum electrolytic or tantalum between OUT and GND is strongly recommended to reduce the voltage droop during hot-plug of downstream peripheral. Higher value output capacitor is better when the output load is heavy. Additionally, bypassing the output with a 1 μ F ceramic capacitor improves the immunity of the device to short-circuit transients.

PCB Layout consideration

The PCB layout should be carefully performed to maximize thermal dissipation and to minimize voltage drop. The following guidelines must be considered:

1. Please place the input capacitors near the IN pin as close as possible.
2. Output decoupling capacitors for load must be placed near the load as close as possible for decoupling high frequency ripples.
3. Locate WS4612 and output capacitors near the load to reduce parasitic resistance and inductance for excellent load transient performance.
4. The negative pins of the input and output capacitors and the GND pin must be connected to the ground plane of the load.
5. Keep IN and OUT traces as wide and short as possible.
