### Dual-Channel High-Precision High-Voltage Current-Sense Amplifier

[Http://www.omnivision-group.com](http://www.omnivision-group.com)

#### Descriptions

The WS74285 dual-channel high-side current-sense amplifier has precision accuracy specifications of  $V_{os}$  less than  $70\mu V$  (max) and gain error less than 0.1%(max).

The WS74285 features an input common-mode voltage range from 2.7V to 76V with 400kHz of small-signal bandwidth, which makes it ideal for interfacing with a SARADC for multichannel multiplexed data acquisition systems.

The WS74285 operates over the  $-40^{\circ}C$  to  $+125^{\circ}C$  temperature range. The WS74285 is offered in 8-pin MSOP and CSP package.

## Functional Diagram

## Detailed Description

The WS74285 high-side, current-sense amplifier features a 2.7V to 76V input common-mode range that is independent of supply voltage. This feature allows the monitoring of supply voltage. This feature allows the monitoring of current out of a battery as low as 2.7V and enables high-side current sensing at voltages greater than the supply voltage ( $V_{DD}$ ). The WS74285 monitors current through a current-sense resistor and amplifies the voltage across the resistor.

High-side current monitoring does not interfere with the ground path of the load being measured, making the WS74285 particularly useful in a wide range of high-voltage systems.

The WS74285 operates as follows: current from the source flows through  $R_{SENSE}$  to the load (see Functional Diagram), creating a sense voltage,  $V_{SENSE}$ . The internal op amp A1 is used to force the current through an internal gain resistor  $R_{G11}$  at RS1+ pin, such that its voltage drop equals the voltage drop ( $V_{SENSE}$ ) across the external sense resistor ( $R_{SENSE}$ ). The internal resistor at RS1- pin ( $R_{G12}$ ) has the same value as  $R_{G11}$  to minimize error. The 2) has the same value as  $R_{G11}$  to minimize error p-channel FET. Its source current is the same as the drain current which flows through a second gain resistor,  $R_{O1}$  producing a voltage  $V_{R01} = V_{SENSE} \times R_{O1}/R_{G11}$ .

The output voltage  $V_{OUT1}$  is produced from a second op amp A2 with the gain  $(1 + R_{F1}/R_{O1})$ . Hence, the  $V_{OUT1} = I_{LOAD1} \times R_{SENSE1} (R_{O1}/R_{G11}) \times (1 + R_{F1}/R_{O1})$  for channel 1 and  $V_{OUT2} = I_{LOAD2} \times R_{SENSE2} (R_{O2}/R_{G21}) \times (1 + R_{F2}/R_{O2})$  for channel 2. Internal resistor  $R_{O1} = R_{O2}$ ,  $R_{G11} = R_{G12} = R_{G21} = R_{G22}$ ,  $R_{F1} = R_{F2}$ . The gain-setting resistors  $R_{O1}$ ,  $R_{O2}$ ,  $R_{G11}$ ,  $R_{G12}$ ,  $R_{G21}$ ,  $R_{G22}$ ,  $R_{F1}$  and  $R_{F2}$  are available in Table1).

Total gain = 12.5V/V for WS74285x1, 20V/V for the WS74285T, 50V/V for the WS74285x3, and 100V/V for the WS74285x4.

## Applications Information

### Recommended Component Values

Ideally, the maximum load current develops the full-scale sense voltage across the current-sense resistor. Choose the gain needed to yield the maximum output voltage required for the application:

$$V_{OUT} = V_{SENSE} \times A_V$$

Where  $V_{SENSE}$  is the full-scale sense voltage, 200mV for gain of 12.5V/V, 125mV for gain of 20V/V, 50mV for gain of 50V/V, 25mV for gain of 100V/V, and  $A_V$  is the gain of the device.

In applications monitoring a high current, ensure that  $R_{SENSE}$  is able to dissipate its own  $I^2R$  loss. If the resistor's power dissipation exceeds the nominal value, its value may drift or it may fail altogether. The WS74285 senses a wide variety of currents with different sense-resistor values.

### Choosing the Sense Resistor

Choose  $R_{SENSE}$  based on the following criteria:

**Voltage Loss** : A high  $R_{SENSE}$  value causes the power- source voltage to degrade through IR loss. For minimal voltage loss, use the lowest  $R_{SENSE}$ .

**Accuracy**: A high  $R_{SENSE}$  value allows lower currents measured more accurately. This is due to offsets becoming less significant when the sense voltage is larger. For best performance select  $R_{SENSE}$  to provide approximately 200mV (gain of 12.5V/V), 125mV (gain of 20V/V), or 50mV (gain of 50V/V), 25mV (gain of 100V/V) of sense voltage for the full-scale current in each application.

**Efficiency and Power Dissipation**: At high current levels the  $I^2R$  losses in  $R_{SENSE}$  can be significant. Consider this when choosing the resistor value and its power dissipation (wattage) rating. In addition, the sense resistor's value might drift if it heats up excessively.

**Inductance**: Keep inductance low if  $I_{SENSE}$  has a large high-frequency component. Wire-wound resistors have the highest inductance, while metal film is somewhat better. Low-inductance, metal-film resistors are also available. Instead of being spiral wrapped around a core, as in metal-film or wire wound resistors, they are a straight band of metal and are available in values under 1Ω.

Take care to eliminate parasitic trace resistance from causing errors in the sense voltage because of the high currents that flow through  $R_{SENSE}$ . Either use a four terminal current-sense resistor or use Kelvin (force and sense) PCB layout techniques.

### Base Station Application Circuit

An example of a typical application (Figure 1) of this high-voltage, high-precision current-sense amplifier is in base-station systems where there is a need to monitor the current flowing in the power amplifier. Such amplifiers, depending on the technology, can be biased up to 50V or 60V thus requiring a current-sense amplifier like the WS74285 with high-voltage common mode. The very low input offset voltage of the WS74285 minimizes the value of the external sense resistor thus resulting in system power-saving.
