description

XDXL3403 quadruple operational amplifiers similar in performance to the XD741, but
with several distinct advantages. They are designed to operate from a single supply over a range of voltages
from 3 V to 36 V. Operation from split supplies also is possible, provided the difference between the two supplies
is 3 V to 36 V. The common-mode input range includes the negative supply. Output range is from the negative
supply to VCC – 1.5 V. Quiescent supply currents are less than one-half those of the XD741.
 and the XDXL3403 is characterized for operation
from 0°C to 70°C.

absolute maximum ratings over operating free-air temperature range (unless otherwise noted)†

Supply voltage (see Note 1): V_{CC+} .... 18 V

V_{CC-} .... −18 V

Supply voltage, V_{CC+} with respect to V_{CC-} .... 36 V

Differential input voltage (see Note 2) .... ±36 V

Input voltage (see Notes 1 and 3) .... ±18 V

Package thermal impedance, θ_{JA} (see Note 4): 3403 .... 80°C/W

Lead temperature 1,6 mm (1/16 inch) from case for 10 seconds .... 260°C

Storage temperature range, T_{stg} .... −65°C to 150°C

† Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTES: 1. These voltage values are with respect to the midpoint between V_{CC+} and V_{CC-}.
2. Differential voltages are at IN+ with respect to IN–.
3. Neither input must ever be more positive than V_{CC+} or more negative than V_{CC-}.
4. The package thermal impedance is calculated in accordance with JESD 51-7.
