

1. DESCRIPTION

The XL324 series are low-cost, quad operational amplifiers with true differential inputs. They have several distinct advantages over standard operational amplifier types in single supply applications. The quad amplifier can operate at supply voltages as low as 3.0 V or as high as 32 V. The common mode input range includes the negative supply, thereby eliminating the necessity for external biasing components in many applications. The output voltage range also includes the negative power supply voltage.

2. FEATURES

- Short Circuited Protected Outputs
- True Differential Input Stage
- Single Supply Operation: 3.0 V to 32 V
- Four Amplifiers Per Package
- Internally Compensated
- Common Mode Range Extends to Negative Supply
- Industry Standard Pinouts
- ESD Clamps on the Inputs Increase Ruggedness without Affecting Device Operation
- These Devices are Pb-Free and RoHS Compliant

3. PIN CONFIGURATIONS AND FUNCTIONS

Pin Functions

PIN		I/O	DESCRIPTION
NAME	SOP14, DIP14, TSSOP14		
Out 1	1	O	Output
1IN -	2	I	Negative input
1IN +	3	I	Positive input
VCC	4	-	Positive (Maximum) Power
2IN +	5	I	Positive input
2IN -	6	I	Negative input
Out 2	7	O	Output
Out 3	8	O	Output
3IN -	9	I	Negative input
3IN +	10	I	Positive input
VEE,GND	11	-	Negative (lowest) power or ground (for single power supply)
4IN +	12	I	Positive input
4IN -	13	I	Negative input
Out 4	14	O	Output

5. SPECIFICATIONS

5.1. Absolute Maximum Ratings

(TA = + 25°C, unless otherwise noted.)

Rating	Symbol	Value	Unit
Power Supply Voltages	V _{CC}	32	Vdc
Single Supply Split Supplies	V _{CC} , V _{EE}	±16	
Input Differential Voltage Range (Note 1)	V _{IDR}	±32	Vdc
Input Common Mode Voltage Range (Note 2)	V _{ICR}	-0.3 to 32	Vdc
Output Short Circuit Duration	t _{SC}	Continuous	
Junction Temperature	T _J	150	°C
Thermal Resistance, Junction-to-Air (Note 3)			
Case 646 (DIP14)	R _{θJA}	118	°C/W
Case 751A (SOP14)		156	
Case 948G (TSSOP14)		190	
Storage Temperature Range	T _{stg}	-50 to +150	°C
ESD Protection at any Pin			
Human Body Model	V _{esd}	2000	V
Machine Model		200	
Operating Ambient Temperature Range			
XL/XD224, XL224-TS	T _A	-25 to +85	°C
XL/XD324, XL324TSS		0 to +70	
XL2902, XD2902N, XL2902-TS		-40 to +105	

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

- [1] Split Power Supplies.
- [2] For supply voltages less than 32 V, the absolute maximum input voltage is equal to the supply voltage.
- [3] All R_{θJA} measurements made on evaluation board with 1 oz. copper traces of minimum pad size. All device outputs were active.

5.2. Operating Conditions

V_{CC} = ±15 V, T_A = 25°C

PARAMETER	TEST CONDITIONS	TYP	UNIT
SR Slew rate at unity gain	R _L = 1 MΩ, C _L = 30 pF, V _I = ±10 V (see Figure 5-1)	0.5	V/μs
B ₁ Unity-gain bandwidth	R _L = 1 MΩ, C _L = 20 pF (see Figure 5-1)	1.2	MHz

[8] The input common mode voltage or either input signal voltage should not be allowed to go negative by more than 0.3 V. The upper end of the common mode voltage range is VCC –1.7 V, but either or both inputs can go to +32 V without damage, independent of the magnitude of VCC.

6. CIRCUIT DESCRIPTION

The XL324 series is made using four internally compensated, two-stage operational amplifiers. The first stage of each consists of differential input devices Q20 and Q18 with input buffer transistors Q21 and Q17 and the differential to single ended converter Q3 and Q4. The first stage performs not only the first stage gain function but also performs the level shifting and transconductance reduction functions. By reducing the transconductance, a smaller compensation capacitor (only 5.0pF) can be employed, thus saving chip area. The transconductance reduction is accomplished by splitting the collectors of Q20 and Q18. Another feature of this input stage is that the input common mode range can include the negative supply or ground, in single supply operation, without saturating either the input devices or the differential to single-ended converter. The second stage consists of a standard current source load amplifier stage.

Each amplifier is biased from an internal-voltage regulator which has a low temperature coefficient thus giving each amplifier good temperature characteristics as well as excellent power supply rejection.

Given: f_o = center frequency
 $A(f_o)$ = gain at center frequency
 Choose value f_o , C

Then:

$$R3 = \frac{Q}{\pi f_o C}$$

$$R1 = \frac{R3}{2A(f_o)}$$

$$R2 = \frac{R1R3}{4Q^2R1 - R3}$$

For less than 10% error from operational amplifier, $\frac{Q_o f_o}{BW} \leq 0.1$
 where f_o and BW are expressed in Hz.

If source impedance varies, filter may be preceded with voltage follower buffer to stabilize filter parameters.
