General Description
XL3057W family consists of A-law monolithic PCM CODEC/filters utilizing the D/A conversion architecture shown inFigure 1, and a serial PCM interface.

The encode portion of each device consists of an input gain adjust amplifier, an active RC pre-filter which eliminates very high frequency noise prior to entering a switched-capacitor band-pass filter that rejects signals below 200 Hz and above 3400 Hz. Also included are auto-zero circuitry and a companding coder which samples the filtered signal and encodes it in the companded μ-law or A-law PCM format. The decode portion of each device consists of an expanding decoder, which reconstructs the analog signal from the companded μ-law or A-law code, a low-pass filter which corrects for the sin x/x response of the decoder output and rejects signals above 3400 Hz followed by a single-ended power amplifier capable of driving low impedance loads. The devices require two 1.536 MHz, 1.544 MHz or 2.048 MHz transmit and receive master clocks, which may be asynchronous; transmit and receive bit clocks, which may vary from 64 kHz to 2.048 MHz; and transmit and receive frame sync pulses. The timing of the frame sync pulses and PCM data is compatible with both industry standard formats.
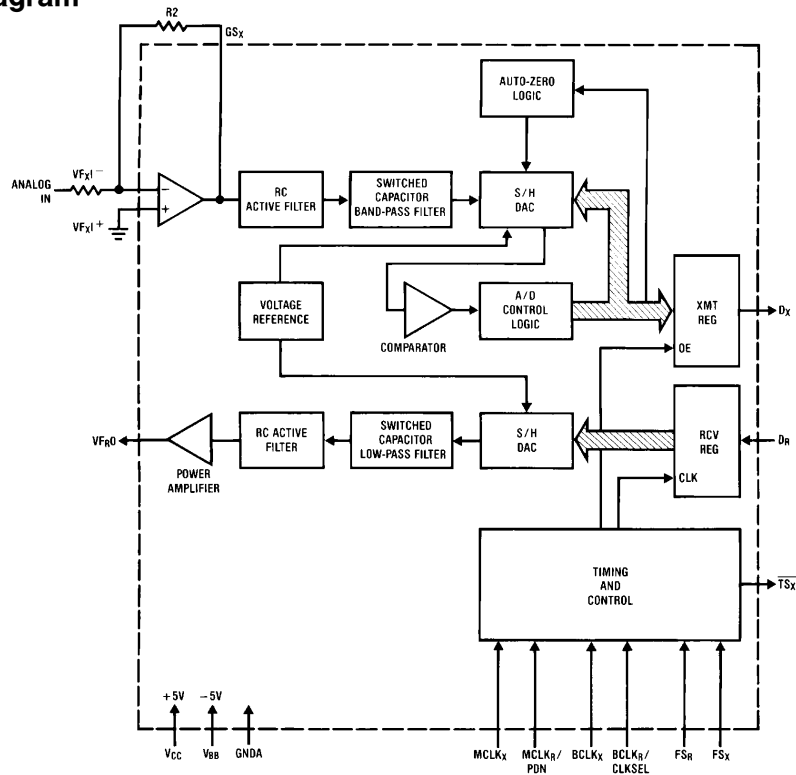

Features

- Complete CODEC and filtering system (COMBO) including:
  — Transmit high-pass and low-pass filtering
  — Receive low-pass filter with sin x/x correction
  — Active RC noise filters
  — μ-law or A-law compatible COder and DECoder
  — Internal precision voltage reference
  — Serial I/O interface
  — Internal auto-zero circuitry

- A-law, 16-pin— XL3057W
- Designed for D3/D4 and CCITT applications
- $\pm 5V$ operation
- Low operating power—typically 50 mW
- Power-down standby mode—typically 3 mW
- Automatic power-down
- TTL or CMOS compatible digital interfaces
- Maximizes line interface card circuit density
- Dual-In-Line or surface mount packages

Connection Diagrams

SOP16

Block Diagram

Pin Description

Symbol	Function
V_{BB}	Negative power supply pin. $V_{BB} = -5V \pm 5\%$.
GNDA	Analog ground. All signals are referenced to this pin.
VF_RO	Analog output of the receive power amplifier.
V_{CC}	Positive power supply pin. $V_{CC} = +5V \pm 5\%$.
FS_R	Receive frame sync pulse which enables $BCLK_R$ to shift PCM data into D_R. FS_R is an 8 kHz pulse train. See *Figures 2* and *3* for timing details.
D_R	Receive data input. PCM data is shifted into D_R following the FS_R leading edge.
$BCLK_R$/CLKSEL	The bit clock which shifts data into D_R after the FS_R leading edge. May vary from 64 kHz to 2.048 MHz. Alternatively, may be a logic input which selects either 1.536 MHz/1.544 MHz or 2.048 MHz for master clock in synchronous mode and $BCLK_X$ is used for both transmit and receive directions (see Table I).
$MCLK_R$/PDN	Receive master clock. Must be 1.536 MHz, 1.544 MHz or 2.048 MHz. May be asynchronous with $MCLK_X$, but

Symbol	Function
	should be synchronous with $MCLK_X$ for best performance. When $MCLK_R$ is connected continuously low, $MCLK_X$ is selected for all internal timing. When $MCLK_R$ is connected continuously high, the device is powered down.
$MCLK_X$	Transmit master clock. Must be 1.536 MHz, 1.544 MHz or 2.048 MHz. May be asynchronous with $MCLK_R$. Best performance is realized from synchronous operation.
FS_X	Transmit frame sync pulse input which enables $BCLK_X$ to shift out the PCM data on D_X. FS_X is an 8 kHz pulse train, see *Figures 2* and *3* for timing details.
$BCLK_X$	The bit clock which shifts out the PCM data on D_X. May vary from 64 kHz to 2.048 MHz, but must be synchronous with $MCLK_X$.
D_X	The TRI-STATE® PCM data output which is enabled by FS_X.
$\overline{TS_X}$	Open drain output which pulses low during the encoder time slot.
GS_X	Analog output of the transmit input amplifier. Used to externally set gain.
VF_XI^-	Inverting input of the transmit input amplifier.
VF_XI^+	Non-inverting input of the transmit input amplifier.

Functional Description

POWER-UP

When power is first applied, power-on reset circuitry initializes the COMBO and places it into a power-down state. All non-essential circuits are deactivated and the D_X and VF_RO outputs are put in high impedance states. To power-up the device, a logical low level or clock must be applied to the $MCLK_R/PDN$ pin *and* FS_X and/or FS_R pulses must be present. Thus, 2 power-down control modes are available. The first is to pull the $MCLK_R/PDN$ pin high; the alternative is to hold both FS_X and FS_R inputs continuously low—the device will power-down approximately 1 ms after the last FS_X or FS_R pulse. Power-up will occur on the first FS_X or FS_R pulse. The TRI-STATE PCM data output, D_X, will remain in the high impedance state until the second FS_X pulse.

SYNCHRONOUS OPERATION

For synchronous operation, the same master clock and bit clock should be used for both the transmit and receive directions. In this mode, a clock must be applied to $MCLK_X$ and the $MCLK_R/PDN$ pin can be used as a power-down control. A low level on $MCLK_R/PDN$ powers up the device and a high level powers down the device. In either case, $MCLK_X$ will be selected as the master clock for both the transmit and receive circuits. A bit clock must also be applied to $BCLK_X$ and the $BCLK_R/CLKSEL$ can be used to select the proper internal divider for a master clock of 1.536 MHz, 1.544 MHz or 2.048 MHz. For 1.544 MHz operation, the device automatically compensates for the 193rd clock pulse each frame.

With a fixed level on the $BCLK_R/CLKSEL$ pin, $BCLK_X$ will be selected as the bit clock for both the transmit and receive directions. Table 1 indicates the frequencies of operation which can be selected, depending on the state of $BCLK_R/CLKSEL$. In this synchronous mode, the bit clock, $BCLK_X$, may be from 64 kHz to 2.048 MHz, but must be synchronous with $MCLK_X$.

Each FS_X pulse begins the encoding cycle and the PCM data from the previous encode cycle is shifted out of the enabled D_X output on the positive edge of $BCLK_X$. After 8 bit periods, the TRI-STATE D_X output is returned to a high impedance state. With an FS_R pulse, PCM data is latched via the D_R input on the negative edge of $BCLK_X$ (or $BCLK_R$ if running). FS_X and FS_R must be synchronous with $MCLK_{X/R}$.

ASYNCHRONOUS OPERATION

For asynchronous operation, separate transmit and receive clocks may be applied. $MCLK_X$ and $MCLK_R$ must be 2.048 MHz for the XL3057W, or 1.536 MHz, 1.544 MHz for the logic levels to the $MCLK_R/PDN$ pin. This will automatically connect $MCLK_X$ to all internal $MCLK_R$ functions (see Pin Description). For 1.544 MHz operation, the device automatically compensates for the 193rd clock pulse each frame. FS_X starts each encoding cycle and must be synchronous with $MCLK_X$ and $BCLK_X$. FS_R starts each decoding cycle and must be synchronous with $BCLK_R$. $BCLK_R$ must be a clock, the logic levels shown in Table 1 are not valid in asynchronous mode. $BCLK_X$ and $BCLK_R$ may operate from 64 kHz to 2.048 MHz.

SHORT FRAME SYNC OPERATION

The COMBO can utilize either a short frame sync pulse or a long frame sync pulse. Upon power initialization, the device assumes a short frame mode. In this mode, both frame sync pulses, FS_X and FS_R, must be one bit clock period long, with timing relationships specified in *Figure 2*. With FS_X high during a falling edge of $BCLK_X$, the next rising edge of $BCLK_X$ enables the D_X TRI-STATE output buffer, which will output the sign bit. The following seven rising edges clock out the remaining seven bits, and the next falling edge disables the D_X output. With FS_R high during a falling edge of $BCLK_R$ ($BCLK_X$ in synchronous mode), the next falling edge of $BCLK_R$ latches in the sign bit. The following seven falling edges latch in the seven remaining bits. All four devices may utilize the short frame sync pulse in synchronous or asynchronous operating mode.

LONG FRAME SYNC OPERATION

To use the long frame mode, both the frame sync pulses, FS_X and FS_R, must be three or more bit clock periods long, with timing relationships specified in *Figure 3*. Based on the transmit frame sync, FS_X, the COMBO will sense whether short or long frame sync pulses are being used. For 64 kHz operation, the frame sync pulse must be kept low for a minimum of 160 ns. The D_X TRI-STATE output buffer is enabled with the rising edge of FS_X or the rising edge of $BCLK_X$, whichever comes later, and the first bit clocked out is the sign bit. The following seven $BCLK_X$ rising edges clock out the remaining seven bits. The D_X output is disabled by the falling $BCLK_X$ edge following the eighth rising edge, or by FS_X going low, whichever comes later. A rising edge on the receive frame sync pulse, FS_R, will cause the PCM data at D_R to be latched in on the next eight falling edges of $BCLK_R$ ($BCLK_X$ in synchronous mode). All four devices may utilize the long frame sync pulse in synchronous or asynchronous mode.

In applications where the LSB bit is used for signalling with FS_R two bit clock periods long, the decoder will interpret the lost LSB as "½" to minimize noise and distortion.

TABLE I. Selection of Master Clock Frequencies

BCLK_R/CLKSEL	Master Clock Frequency Selected
	XL3057W
Clocked	2.048 MHz
0	1.536 MHz or 1.544 MHz
1	2.048 MHz

Functional Description (Continued)

TRANSMIT SECTION

The transmit section input is an operational amplifier with provision for gain adjustment using two external resistors, see Figure 4. The low noise and wide bandwidth allow gains in excess of 20 dB across the audio passband to be realized. The op amp drives a unity-gain filter consisting of RC active pre-filter, followed by an eighth order switched-capacitor bandpass filter clocked at 256 kHz. The output of this filter directly drives the encoder sample-and-hold circuit. The A/D is of companding type according to m-law XL3057W coding conventions. A precision voltage reference is trimmed in manufacturing to provide an input overload (tMAX) of nominally 2.5V peak (see table of Transmission Characteristics). The FSX frame sync pulse controls the sampling of the filter output, and then the successive-approximation encoding cycle begins. The 8-bit code is then loaded into a buffer and shifted out through DX at the next FSX pulse. The total encoding delay will be approximately 165 ms (due to the transmit filter) plus 125 ms (due to encoding delay), which totals 290 ms. Any offset voltage due to the filters or comparator is cancelled by sign bit integration.

RECEIVE SECTION

The receive section consists of an expanding DAC which drives a fifth order switched-capacitor low pass filter clocked at 256 kHz. The decoder is A-law XL3057W the 5th order low pass filter corrects for the sin x/x attenuation due to the 8 kHz sample/hold. The filter is then followed by a 2nd order RC active post-filter/ power amplifer capable of driving a 600X load to a level of 7.2 dBm. The receive section is unity-gain. Upon the occurrence of FSR, the data at the DR input is clocked in on the falling edge of the next eight BCLKR (BCLKX) periods. At the end of the decoder time slot, the decoding cycle begins, and 10 ms later the decoder DAC output is updated. The total decoder delay is E 10 ms (decoder update) plus 110 ms (filter delay) plus 62.5 ms ((/2 frame), which gives approximately 180 ms.

Absolute Maximum Ratings

V_{CC} to GNDA	7V
V_{BB} to GNDA	$-7V$
Voltage at any Analog Input or Output	$V_{CC} + 0.3V$ to $V_{BB} - 0.3V$
Voltage at any Digital Input or Output	$V_{CC} + 0.3V$ to GNDA $- 0.3V$
Operating Temperature Range	$-25°C$ to $+125°C$
Storage Temperature Range	$-65°C$ to $+150°C$
Lead Temperature (Soldering, 10 seconds)	300°C
ESD (Human Body Model)	2000V
Latch-Up Immunity $= 100$ mA on any Pin	

## Electrical Characteristics

Unless otherwise noted, limits printed in **BOLD** characters are guaranteed for $V_{CC} = 5.0V \pm 5\%$, $V_{BB} = -5.0V \pm 5\%$; $T_A = 0°C$ to 70°C by correlation with 100% electrical testing at $T_A = 25°C$. All other limits are assured by correlation with other production tests and/or product design and characterization. All signals referenced to GNDA. Typicals specified at $V_{CC} = 5.0V$, $V_{BB} = -5.0V$, $T_A = 25°C$.

Transmission Characteristics (Continued) Unless otherwise noted, limits printed in BOLD characters are guaranteed for VCC e 5.0V g5%, VBB e b5.0V g5%; TA e 0§C to 70§C by correlation with 100% electrical testing at TA e e 0V, f e 1.02 kHz, VIN e 0 dBm0, transmit input amplifier connected for unity gain non-inverting. Typicals specified at VCC e 5.0V, VBB e b5.0V, TA e 25§C.

Symbol	Parameter	Conditions	Min	Typ	Max	Units
SOS	Spurious Out-of-Band Signals at the Channel Output	Loop Around Measurement, 0 dBm0, 300 Hz to 3400 Hz Input PCM Code Applied at D_R.			-30	dB
		4600 Hz–7600 Hz			-30	dB
		7600 Hz–8400 Hz			-40	dB
		8400 Hz–100,000 Hz			-30	dB
DISTORTION						
STD_X STD_R	Signal to Total Distortion Transmit or Receive Half-Channel	Sinusoidal Test Method (Note 3) Level $=$ 3.0 dBm0	**33**			dBC
		$=$ 0 dBm0 to -30 dBm0	**36**			dBC
		$= -40$ dBm0 XMT	**29**			dBC
		RCV	**30**			dBC
		$= -55$ dBm0 XMT	**14**			dBC
		RCV	**15**			dBC
SFD_X	Single Frequency Distortion, Transmit				$-\textbf{46}$	dB
SFD_R	Single Frequency Distortion, Receive				$-\textbf{46}$	dB
IMD	Intermodulation Distortion	Loop Around Measurement, $VF_X{}^+ = -4$ dBm0 to -21 dBm0, Two Frequencies in the Range 300 Hz–3400 Hz			$-\textbf{41}$	dB
CROSSTALK						
CT_{X-R}	Transmit to Receive Crosstalk, 0 dBm0 Transmit Level	f $=$ 300 Hz–3400 Hz $D_R =$ Quiet PCM Code		-90	$-\textbf{75}$	dB
CT_{R-X}	Receive to Transmit Crosstalk, 0 dBm0 Receive Level	f $=$ 300 Hz–3400 Hz, VF_XI $=$ Multitone (Note 2)		-90	$-\textbf{70}$	dB

ENCODING FORMAT AT D_X OUTPUT

	XL3057W A-Law (Includes Even Bit Inversion)							
V_{IN} (at GS_X) $= +$ Full-Scale	1	0	1	0	1	0	1	0
V_{IN} (at GS_X) $=$ 0V	1	1	0	1	0	1	0	1
	0	1	0	1	0	1	0	1
V_{IN} (at GS_X) $= -$ Full-Scale	0	0	1	0	1	0	1	0

Note 1: Measured by extrapolation from the distortion test result at -50 dBm0.

Note 2: $PPSR_X$, $NPSR_X$, and CT_{R-X} are measured with a -50 dBm0 activation signal applied to VF_XI$^+$.

Note 3: Devices are measured using C message weighted filter for μ-Law and psophometric weighted filter for A-Law.

Applications Information

POWER SUPPLIES

While the pins of the XL3057W family are well protected against electrical misuse, it is recommended that the standard CMOS practice be followed, ensuring that ground is connected to the device before any other connections are made. In applications where the printed circuit board may be plugged into a "hot" socket with power and clocks already present, an extra long ground pin in the connector should be used.

All ground connections to each device should meet at a common point as close as possible to the GNDA pin. This minimizes the interaction of ground return currents flowing through a common bus impedance. 0.1 μF supply decoupling capacitors should be connected from this common ground point to V_{CC} and V_{BB}, as close to the device as possible.

For best performance, the ground point of each CODEC/FILTER on a card should be connected to a common card ground in star formation, rather than via a ground bus.

This common ground point should be decoupled to V_{CC} and V_{BB} with 10 μF capacitors.

RECEIVE GAIN ADJUSTMENT

For applications where a XL3057W family CODEC/filter re-ceive output must drive a 600Ω load, but a peak swing lower than ± 2.5V is required, the receive gain can be easily ad-justed by inserting a matched T-pad or π-pad at the output. Table II lists the required resistor values for 600Ω termina-tions. As these are generally non-standard values, the equa-tions can be used to compute the attenuation of the closest practical set of resistors. It may be necessary to use un-equal values for the R1 or R4 arms of the attenuators to achieve a precise attenuation. Generally it is tolerable to allow a small deviation of the input impedance from nominal while still maintaining a good return loss. For example a 30dB return loss against 600Ω is obtained if the output imped-ance of the attenuator is in the range 282Ω to 319Ω (as-suming a perfect transformer).

T-Pad Attenuator
$$R3 = \sqrt{\frac{Z1.Z2}{2}} \left(\frac{N^2 - 1}{N} \right)$$

$$R3 = Z1 \left(\frac{N^2 - 1}{N^2 - 2NS + 1} \right)$$
