

150 Watts

- 180 - 425VDC Input Range
- Regulated Single Output
- Industry Standard Quarter Brick
- 3kVAC Isolation
- Output Trim -20% to +10%
- Remote On/Off
- Overtemperature Protection
- -40°C to +100°C Operation
- 3 Year Warranty

Dimensions:

QHL150:

2.28 x 1.45 x 0.5" (57.9 x 36.8 x 12.7 mm)

The QHL150 series offers a compact 150W DC-DC solution in an industry standard quarter brick package. This series of modules enables effective construction of distributed power architectures from AC front ends, PFC front ends and battery systems.

Input Fusing and Safety Considerations

The QHL150 series converters have no internal fuse. For safety and system protection, always use an input line fuse. A 2.0A time delay fuse is recommended. It is also recommended the circuit has a transient voltage suppressor diode (TVS) across the input terminals to protect the unit against surges, spikes and input reverse voltage (as shown). A suitable part is SMCJ440A.

Suggested Basic Layout

Output Voltage Sensing

The module will automatically trim the output voltage via the sense pins to the default values either locally or at the load. If not required, the sense pins should be connected locally as indicated in the example EMC circuit.

Output Voltage Adjustment

The Trim input permits the user to adjust the output voltage up by 10% or down by 20%. This is accomplished by connecting an external resistor between the Trim pin and -sense to trim up, or between the trim pin and +sense to trim down.

Thermal Resistance Information

Airflow Derating Graph - Without Heatsink

Air Flow Rate	Typical Rca
Natural Convection 20ft/min (0.1m/s)	10.1°C/W
100ft/min (0.5m/s)	8.0°C/W
200ft/min (1.0m/s)	5.4°C/W
300ft/min (1.5m/s)	4.4°C/W
400ft/min (2.0m/s)	3.4°C/W

Example (Without Heatsink)

To determine the minimum airflow necessary for a QHL150300S12 operating at an input voltage of 300V, an output current of 12.5A, and a maximum ambient temperature of 40°C:

Determine Power dissipation (Pd): $P_d = P_i - P_o = P_o(1-\eta)/\eta$,

$$P_d = 12V \times 12.5A \times (1-0.89) / 0.89 = 18.54$$

Where P_i = Input power, P_o = Output Power and η = Efficiency

Determine airflow from airflow derating graph using data points for $P_d = 18.54W$ and $T_a = 40^\circ C$

Minimum airflow = 400ft./min.

To check that the maximum case temp of 100°C is not exceeded:

Maximum temperature rise is

$$\Delta T = P_d \times R_{ca} = 18.54 \times 3.40 = 63.4^\circ C.$$

Maximum case temperature is

$$T_c = T_a + \Delta T = 40 + 63 = 103^\circ C < 100^\circ C.$$

Where: R_{ca} is the thermal resistance from case to ambient environment. T_a is ambient temperature and T_c is case temperature.
