## CONSTRUCTION

The resistor is constructed on top of a high-grade ceramic body. Internal metal electrodes are added on each end to make the contacts to the thick film resistive element. The composition of the resistive element is a noble metal imbedded into a glass and covered by a second glass to prevent environment influences. The resistor is laser trimmed to the rated resistance value. The resistor is covered with a protective epoxy

$\mathrm{V}=\sqrt{(\mathrm{P} \times \mathrm{R})}$
or max. working voltage whichever is less
Where
$V=$ Continuous rated $D C$ or AC (rms) working voltage ( V )
$\mathrm{P}=$ Rated power (W)
