### LINEAR INTEGRATED CIRCUIT

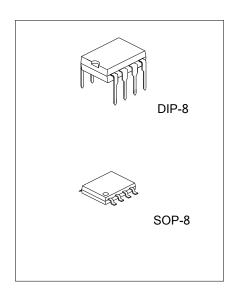

#### CURRENT MODE PWM CONTROL CIRCUITS

#### DESCRIPTION

The UTC3844D/E provides the necessary features to implement off-line or DC to DC fixed frequency current mode control schemes with a minimal external parts count. Internally implemented circuits include under-voltage lockout featuring start up current less than 0.5mA, a precision reference trimmed for accuracy at the error amp input, logic to insure latched operation, a PWM comparator which also provides current limit control, and a totem pole output stage designed to source or sink high peak current.The output stage, suitable for driving N channel MOSFETs, is low in the off state.

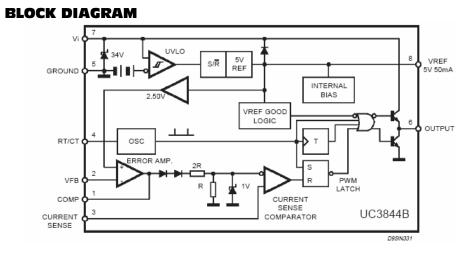

#### **FEATURES**

\*Optimized for off-line and DC to DC converts \*Low start up current(<0.5mA) \*Automatic feed forward compensation \*Pulse-by-Pulse current limiting \*Enhanced load response characteristics \*Under-voltage lockout with hysteresis \*Double pulse Suppression \*High current totem pole output \*Internally trimmed bandgap reference \*500kHz operation \*Low Ro error amp

Start-up Current	Ist			0.3	0.5	mA
Operating Supply Current	ICC(opr)	Vpin 2=Vpin 3=0V		12	17	mA
Vcc Zener Voltage	Vz	Icc=25mA		34		V

note 2:These parameters, although guaranteed , are not 100% tested in production.

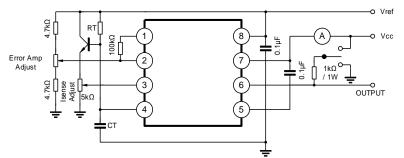

note 3:Parameters measured at trip point of latch with Vpin 2=0.

note 4:Gain defined as:

$$A = \frac{\Delta V \text{pin 1}}{\Delta V \text{pin 3}} \quad ;0 \leq V \text{pin 3} \leq 0.8V$$

note 5:Adjust Vcc above the start threshold before setting at 15V.

#### **OPEN-LOOP LABORATORY TEST CIRCUIT**

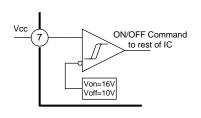

High peak current associated with capacitive loads necessitate careful grounding techniques. Timing and bypass capacitors should be connected close to pin 5

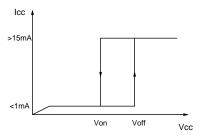

in single point GND.The transistor and  $5k\Omega$  potentio meter are used to sample the oscillator waveform and apply an adjustable Ramp to Pin 3.

### LINEAR INTEGRATED CIRCUIT

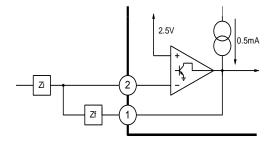

#### **UNDER-VOLTAGE LOCKOUT**

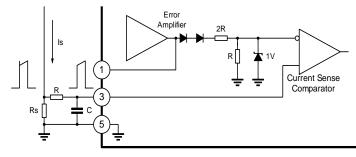

During Under-Voltage Lockout, the output driver is biased to a high impedance state. Pin 6 should be shunt to GND with a bleeder resistor to prevent activating the power switch with output leakage currents.

#### **ERROR AMPLIFIER CONFIGURATION**

Error amplifier can source or sink up to 0.5mA

#### **CURRENT SENSE CIRCUIT**

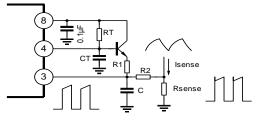

Peak current (Is) determined by the formula: Ismax=10V/Rs. A small RC filter be required to suppress switch transients.

### LINEAR INTEGRATED CIRCUIT

#### **SLOPE COMPENSATION**

A fraction of the oscillator ramp can be resistively summed with the current sense signal to provide slope compensation for converts requiring duty cycles over 50%.Note that capacitor C, forms a filter with R2 to suppress the leading edge switch spikes.

### LINEAR INTEGRATED CIRCUIT

#### **SHUTDOWN TECHNIQUES**

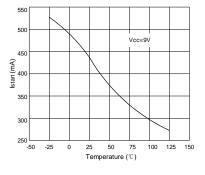

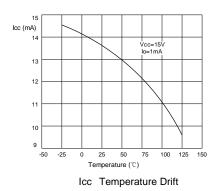

Shutdown UTC3844D/E can be accomplished by two methods; either raise pin 3 above 1V or pull Pin 1 below a voltage two diode drops above ground. Either method caused the output of PWM comparator to be high(refer to block diagram). The PWM latch is reset dominant so that the output will remain low until the next clock cycle after the shutdown condition at pins a and/or 3 is removed .In one example, an externally latched shut down may be accomplished by adding an SCR which be reset by cycling Vcc below the lower UVLO threshold. At this point type reference turns off allowing the SCR to reset.

#### **ELECTROSTATIC DISCHARGE CAUTION**

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage handing to prevent electrostatic damage to the device.
