

### DESCRIPTION

ZD1117 is a series of low dropout three-terminal regulators with a dropout of 1.3V at 1A load current. ZD1117 features a low standby current 2mA.

Other than a fixed version ( $V_{out} = 1.2V, 1.5V, 1.8V, 2.5V, 3.3V, 5V, \text{ and } 12V$ ), ZD1117 has an adjustable version, which can provide an output voltage from 1.25 to 12V with only two external resistors.

ZD1117 offers thermal shut down and current limit functions, to assure stability of chip and power system. Trimming technique is used to guarantee output voltage accuracy within  $\pm 2\%$ . Other output voltage accuracy such as  $\pm 1\%$  can be customized on demand.

ZD1117 is available in SOT-223, TO-252, SOT-89-3 power packages.

### TYPICAL APPLICATION

Application circuit ZD1117 fixed version

### FEATURES

- Other than a fixed version and an adjustable version, output value can be customized on demand.
- Maximum output current is 1A
- Range of operation input voltage: Max 18V
- Standby current: 2mA (typ.)
- Line regulation: 0.1%/V (typ.)
- Load regulation: 10mV (typ.)
- Environment Temperature:  $-40^{\circ}C \sim 85^{\circ}C$
- Compatible with tantalum capacitor, electrolytic capacitor and MLCC.

### APPLICATIONS

- Power Management for Computer Mother Board, Graphic Card
- LCD Monitor and LCD TV
- DVD Decode Board
- ADSL Modem
- Post Regulators for Switching Supplies

### TYPICAL ELECTRICAL CHARACTERISTIC

## ABSOLUTE MAXIMUM RATING

Parameter		Value
Max Input Voltage		18V <sup>(*)</sup>
Max Operating Junction Temperature(Tj)		150°C
Ambient Temperature(Ta)		-40°C – 85°C
Package Thermal Resistance(θjc)	SOT-223	20°C / W
	TO-252	12.5°C / W
Storage Temperature(Ts)		-40°C - 150°C
Lead Temperature & Time		260°C, 10S

**Note:** Exceed these limits to damage to the device. Exposure to absolute maximum rating conditions may affect device reliability.

## RECOMMENDED WORK CONDITIONS

Parameter		Value
Input Voltage Range		Max. 16V <sup>(*)</sup>
Operating Junction Temperature(Tj)		-40°C –125°C

<sup>(\*)</sup>Exceptional for ZD1117-12V, the maximum input voltage for ZD1117-12V is 20V.

**Note1:** All test are conducted under ambient temperature 25°C and within a short period of time 20ms

**Note2:** Load current smaller than minimum load current of ZD1117-ADJ will lead to unstable or oscillation output.

## BLOCK DIAGRAM

## DETAILED DESCRIPTION

ZD1117 is a series of low dropout voltage, three terminal regulators. Its application circuit is very simple: the fixed version only needs two capacitors and the adjustable version only needs two resistors and two capacitors to work. It is composed of some modules including start-up circuit, bias circuit, bandgap, thermal shutdown, current limit, power transistors and its driver circuit and so on.

The thermal shut down modules can assure chip and its application system working safety when the junction temperature is larger than 140°C.

The bandgap module provides stable reference voltage, whose temperature coefficient is compensated by careful design considerations. The temperature coefficient is under 100 ppm/°C. And the accuracy of output voltage is guaranteed by trimming technique.

## TYPICAL APPLICATION

ZD1117 has an adjustable version and six fixed versions (1.2V, 1.5V, 1.8V, 2.5V, 3.3V, 5V and 12V)

### Fixed Output Voltage Version

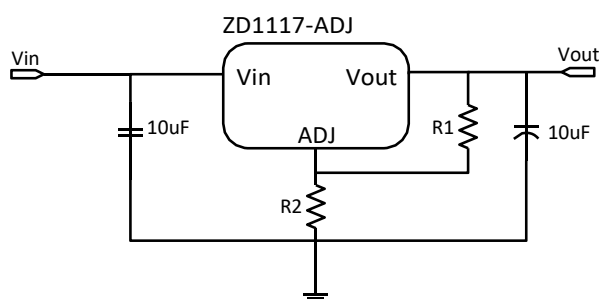

Application circuit of ZD1117 fixed version

- 1) Recommend using 10uF tan capacitor as bypass capacitor (C1) for all application circuit.
- 2) Recommend using 10uF tan capacitor to assure circuit stability.

### Adjustable Output Voltage Version

ZD1117-ADJ provides a 1.25V reference voltage. Any output voltage between 1.25V~12V can be achievable by choosing two external resistors (schematic is shown below), R1 and R2

Application Circuit of ZD1117-ADJ

The output voltage of adjustable version follows the equation:  $V_{out} = 1.25 \times (1 + R_2/R_1) + I_{Adj} \times R_2$ . We can ignore  $I_{Adj}$  because  $I_{Adj}$  (about 50uA) is much less than the current of R1 (about 2~10mA).

- 1) To meet the minimum load current (>10mA) requirement, R1 is recommended to be 125ohm or lower. As ZD1117-ADJ can keep itself stable at load current about 2mA, R1 is not allowed to be higher than 625ohm.
- 2) Using a bypass capacitor ( $C_{ADJ}$ ) between the ADJ pin and ground can improve ripple rejection. This bypass capacitor prevents ripple from being amplified as the output voltage is increased. The impedance of  $C_{ADJ}$  should be less than R1 to prevent ripple from being amplified. As R1 is normally in the range of  $100\Omega\sim 500\Omega$ , the value of  $C_{ADJ}$  should satisfy this equation:  $1/(2\pi \times f_{ripple} \times C_{ADJ}) < R1$ .

## THERMAL CONSIDERATIONS

We have to take heat dissipation into great consideration when output current or differential voltage of input and output voltage is large. Because in such cases, the power dissipation consumed by ZD1117 is very large. ZD1117 series uses SOT-223 package type and its thermal resistance is about  $20^{\circ}\text{C}/\text{W}$ . And the copper area of application board can affect the total thermal resistance. If copper area is  $5\text{cm} \times 5\text{cm}$  (two sides), the resistance is about  $30^{\circ}\text{C}/\text{W}$ . So the total thermal resistance is about  $20^{\circ}\text{C}/\text{W} + 30^{\circ}\text{C}/\text{W}$ . We can decrease total thermal resistance by increasing copper area in application board. When there is no good heat dissipation copper are in PCB, the total thermal resistance will be as high as  $120^{\circ}\text{C}/\text{W}$ , then the power dissipation of ZD1117 could allow on itself is less than 1W. And furthermore, ZD1117 will work at junction temperature higher than  $125^{\circ}\text{C}$  under such condition and no lifetime is guaranteed.
